

Revised Add Recipe mobile app experience

App-native mock focused on the biggest failed-input patterns: empty submits, search behavior, emails, domain-only inputs, and malformed links.

Default state

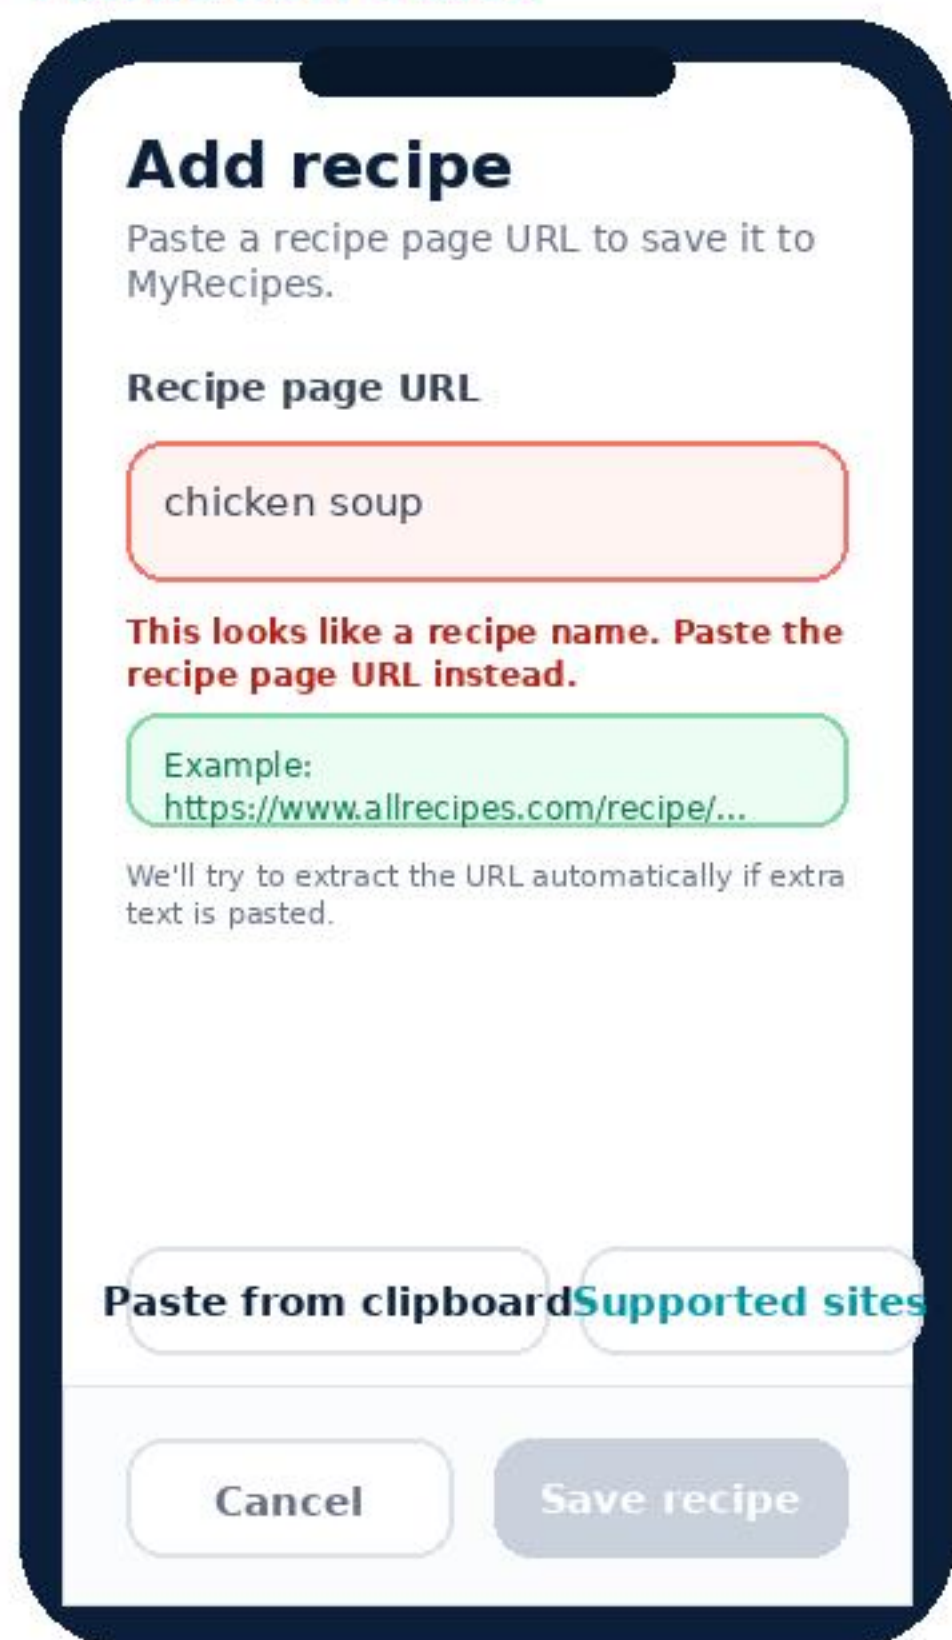

Add recipe
Paste a recipe page URL to save it to MyRecipes.

Recipe page URL

Use a recipe page link — not a recipe name or site homepage.
We'll try to extract the URL automatically if extra text is pasted.

Validation state

Add recipe
Paste a recipe page URL to save it to MyRecipes.

Recipe page URL

This looks like a recipe name. Paste the recipe page URL instead.

Example:

We'll try to extract the URL automatically if extra text is pasted.

What changed

The field is clearly framed as a recipe page URL input, not search.

Save stays disabled until the input looks actionable.

Validation copy examples

- Recipe name: Paste the recipe page URL instead.
- Email: Paste a recipe link instead.
- Site homepage: Paste the full recipe page URL.
- Malformed link: Try pasting the full recipe page URL again.

Why this fits the app

- Paste-from-clipboard is visible and close to the field
- Inline feedback is short and app-friendly
- Users can recover without restarting the flow
