PRD Phase I

New Recipe Clipper Product Requirements Doc

1 OVERVIEW

1.1 Business Goals

- Increase user engagement and retention by making MYR the central hub for all recipe saving, and expand reach beyond owned content to attract new and existing users.

1.2 Product Purpose / Value Proposition

- Getting MyRecipes closer to being the universal recipe box for the internet by allowing users to save recipes from other online sources.

1.3 Target Audience Profile(s)

- MyRecipes users who want to save recipes from outside of the network.

1.4 Desired User Outcomes

- Users can save other online recipes via a URL input.

1.5 Metrics of Success

- Increase in the number of saves per user
- Marketing tactic for user acquisition

1.6 Potential Risks / Negative Impacts

- SEO authority
Risk: Outbound links boost other publishers
Mitigation: Use rel="nofollow" on all external links
- Legal / copyright
Risk: Issues displaying third-party images or ratings
Mitigation: Get legal sign-off, limit to safe fields, remove risky ones
- Session depth
Risk: Users leave MyRecipes and don't return
Mitigation: Open links in new tabs, surface related MyRecipes content
- Brand dilution
Risk: External recipes overshadow MyRecipes content
Mitigation: Prioritize and badge MyRecipes recipes in saved views
- Scraping reliability
Risk: Metadata may be missing, blocked, or break

Mitigation: Add fallbacks, monitor failures, update scraping logic

1.7 Underlying Assumptions

- Legal approval is required to display third-party recipe images, titles, and links
- Use of deck, star ratings, and review counts needs confirmation from Alison Mango with Jenn Bishop
- We assume recipe sites will not block scraping or metadata extraction (technical/legal risk)
- Recipes will not be hosted or displayed in full on MyRecipes; all links point back to the original source
- The MVP will only support URL copy/paste (no share sheet, extension, or image-based clipping yet)

1.9 Target Time-Frame

- Q4 2025

2 KNOWN REQUIREMENTS

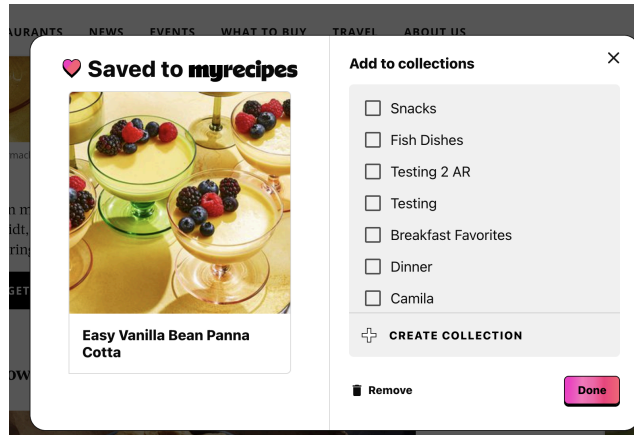

2.1 Phase 1 / MVP

Entry Points

- Button/callout on the MyRecipes homepage
- Button/callout in the MyRecipes favorites page

Behavior/flow

- User clicks “Add Recipe”
- User pastes a recipe URL and presses Save
 - User copies a URL from another site (Ctrl-C / right-click copy / double-tap on mobile) and pastes it into the MyRecipes input field (Ctrl-V / right-click paste / mobile paste).
- System imports structured data where available: title, image, source
- Save modal opens, which displays all the same information as it does today on the brand sites
 - Recipe image & Title
 - List of collections

- Users can organize in a collection and/or press done

Post-save behavior

- Saved recipe behaves like any other bookmark in MyRecipes
 - Recipe card in MYR displays the same information, the original source is listed on card

- Saved recipes appear in Favorites and relevant collections
- Clicking a recipe opens the Quick View modal with imported data (title, image, deck, rating, rating count, source)
- “View Recipe” links back to the original external site
- Users can unsave an imported recipe card

User Flow

2.2 Phase 2

- Support saving custom recipes via input form (typed directly into MyRecipes)
- Support saving custom recipes via OCR (image upload of handwritten or scanned recipes)

2.2 Phase 3 Consideration

- Save recipes from social media sources (Instagram, TikTok)
- Potential inclusion of external recipes in MyRecipes search and personal favorites search (depends on search team)
- If the original URL returns a 404 or redirect, the system should display a note such as “Original recipe no longer available” so the user understands why the link fails.
- Automatic updates of recipe card data
- Future versions may leverage browser or app-specific auto-paste triggers if supported
- Include metadata star ratings, rating count, and total time
- JavaScript on other sites linking back to MYR

3 TEAMS / DEPENDENCIES

- Flex 2 (Chantelle James Luke Pierotti Aleza Leinwand)

4 COMPETITORS

📌 Recipe Clipping Competitive Features Comparison

5 DESIGNS

📁 myr-recipe-clipper

6 Launch and Rollout Plan

- Phase 1
 - 11/24 Dev Complete
 - 11/24 QA&UAT Testing Kickoff
 - 12/4 Target Launch

Goals & Opportunity Assessment

(Recipe Clipper MVP: URL Paste)

- Output: Add Recipe button in MyRecipes that lets users paste a URL to save a recipe.
- Impact for users:
 - Provides a single home for all recipes, not just brand-owned ones
 - Reduces the friction of scattered bookmarks, screenshots, and notes
 - Makes it easier to organize and find recipes later
 - Creates trust that recipes are safe and accessible across devices
 - Most important impact: Users now have one consistent, reliable place to save and retrieve recipes from anywhere.
- Product outcome: Increase the number of saved recipes per user and increase collection creation.
- Business outcome: Grow repeat sessions by giving users a reason to return to manage and cook from their saved recipes.

CTP

Jira Ticket HOME-3589: MyRecipe Recipe Clipper

Overview

Build Phase 1 of the Recipe Clipper. Users can add a recipe by pasting a URL into MyRecipes. The system imports basic metadata (title, image, source, ratings, total time) and saves the recipe into the user's collections and favorites. Clicking a saved recipe opens a quick view modal with a link back to the original site.

High-level requirements

- Entry points: Add Recipe button on homepage and favorites page
- Input: User pastes URL and presses Save
- System: Imports recipe metadata (fallback if no structured data = save URL and image only)
- Save Modal: Displays title, image, list of collections; allows user to assign a collection or skip
- Post-save: Recipe saved as a card, visible in Favorites and Collections, clickable to quick view modal
- Quick View: Displays imported metadata (title, image, ratings, source) with outbound link to original site

Technical documentation, architectural diagram or technical agreement if started

Designs

[Figma](#)

Desired timeframe

Q4

RICE Scoring

Reach: High - potential to touch a large % of active MyRecipes users

Impact: High - major user value unlock

Confidence: Medium - depends on adoption rate and consistency of metadata extraction across external sites

Effort: TBD (engineering to size once technical approach for extraction is defined)

Preparing the Initiative

Initiative Owners include the **Product Owner** and **Technical Owner**. They are responsible for:

- **Aligning on the details together** before moving forward.
- Creating and adding details to the [Jira initiative](#)
 - **Desired outcome**
 - High level **requirements**, PRD if started
 - **Technical documentation**, architectural diagram or technical agreement if started
 - Desired **timeframe**, including hard dates if there are contractual or sales dates
 - **Reach, Impact** and **Confidence** scores for [RICE](#), with links to supporting data
- Update the *Cross Team* field as appropriate. If you are unsure, discuss with leadership for your business unit.
- Initiatives may also have **additional leads** that should be added to the initiative:
 - *PDO Lead* (Program Lead and/or Delivery Lead)
 - *Design Lead*
 - *Security Lead*

Kickoff

Initiative Planning should kickoff by bringing together the team leads identified by Explorers for the purpose of discussing the following:

1. **Product** to present the business context to the group
2. **Design** to walk the group through the prototype (if applicable)
3. **Product** to walk the group through the requirements document
4. **Engineering** to walk through any visuals (e.g. architectural diagrams)

Depending on the size & complexity of the initiative, the kickoff can be combined with the Feature Planning session for efficiency.

Open Questions

Do we need to do maintenance on the data? What happens if the primary image on the source website changes?

No ongoing maintenance. Once clipped, the recipe becomes the user's copy. If the source image changes, we keep the saved version. Automatic updates could be added later but are not needed for V1.

What happens if the source website deletes the recipe? The URL will then lead to a 404 or redirect. Do we need to do anything?

- **MVP – User responsibility:** Do nothing in the background. If the link is dead, the saved card still shows title and image, but the external link fails. It's up to the user to unsave it.
- **Phase 2 – System responsibility:** Add link health checks. When users open their recipe box, detect 404s and display a note like "Original recipe no longer available." This helps users manage dead recipes without auto-deleting them.

Are users allowed to unsave their imported recipes? Do we need to clean up the data we have saved if they do?

Yes. Users can unsave, and when they do, their copy is deleted from our system.

What happens if the site's recipe data is incomplete or missing cook time, image, or title?

We save whatever data we can capture. Users can edit missing details later.

If a user enters a non-recipe URL, how will we handle it?

We show an error message that no recipe data could be found. Nothing is saved.

What happens if images change on the source site?

We save the image at the time of clipping. No ongoing checks. A refresh option could be added in the future.

What happens if recipes get deleted or moved?

If the original link breaks, the saved card still shows what we captured. It's up to the user to unsave. A future enhancement could add a note like "Original recipe no longer available."

What happens when users unsave recipes?

They can remove any saved recipe, and we will delete their copy from our system.

Monetization

- **Goals & Hypothesis:** The product goal is to increase engagement and retention by positioning MyRecipes as the central hub for all recipe saving. By expanding beyond owned content, we aim to attract new and existing users and move closer to becoming the universal recipe box for the internet.
 - This initiative will:
 - Provide one home for all saved recipes
 - Reduce friction from scattered bookmarks, screenshots, and notes
 - Make it easier to organize and find recipes later
 - Build trust that recipes are safe and accessible across devices
 - **Engagement Impact**
 - Increase saves per user
 - Drive repeat sessions as users return to manage and cook from their saved recipes
 - Support user acquisition as a marketing tactic
- **Revenue Impact:** Phase 1 (MVP) will prioritize adoption and engagement with no direct monetization at launch. Indirect revenue impact is expected through:
 - More impressions per session as users save and revisit recipes
 - Stronger engagement loops that increase ad revenue over time
- **Proposed placement:** Add a (desktop and mobile) “Save a Recipe from Anywhere” block:
 - Homepage: below Recent Saves
 - This will move down the first leaderboard fixed 1
 - Save page: below Recently Saved
 - Currently has no ads

Revenue Development Needs

It would be helpful for RevDev to provide:

- Any trade-offs from shifting the first ad down on the homepage
- Recommended ad placements within the user flow

Helpful for RevDev to have insight into...

- **Timeline:** Q4 Tier 0 Initiative - Feature planning is happening the week of 9/15, with an ideal launch targeted before the holidays.
- **Dependencies:** Legal requirements are still being worked through.
- **Testing:** Design is running UX testing starting the week of 9/15
- **Inputs:**  Figma
- **Results:** Dashboards will be added by Farris.

–DRAFT–

Phase 1 / MVP

- **Focus:** User adoption and engagement, no direct monetization at launch
- **Monetization impact:**
 - Increased impressions per session from users saving and revisiting recipes
 - Stronger engagement loops that indirectly grow ad revenue
- **Notes:** Establish usage baseline before layering in monetization

Phase 2

Phase 3

Technical Requirements

Recipe Clipper Requirements and Safeguards

1. Recipe Scraping Approach

- Scrape recipe data using structured schema metadata (Recipe markup) when available.
- Extract key fields: title, image, URL.
- If schema data is missing:
 - Only allow clipping from sites with schema markup.
 - Recipe markup documentation from [google](#) and [schema.org](#)
 - Ensure recipe image location is noindex in response header and apply a noindex meta header
 - Ensure images have alt text
 - Ensure any link text makes it clear what recipe you are clicking to - if the image is linked, make sure the alt text provides the context
 - Make sure all recipe links that leave the domain are initiating the `<Page: Normalization SEO logic for link rel attribute>` call.
 - Show a user-facing message when clipping isn't possible.
 - Example: "Looks like we can't save this one because the site doesn't allow it."

Safeguards

- Prevent users from uploading the same recipe more than once.
- Block explicit images or offensive language.

2. Handling Paywalls

- The scraper will not bypass paywalls.
- Clipping is limited to publicly available recipe content.
- If blocked, show users: "Looks like we can't save this one because the site doesn't allow it."

3. Image Storing

Storage Method

- Recipe images scraped from third-party sources must be stored using the UGC image service.
- Images will not be stored in the database.

Performance Optimization

- Images must be cached on the CDN.

- The frontend (FE) must render recipe images from the CDN, not directly from third-party sites, to avoid performance issues.

Usage Restrictions

- Strict safeguard: recipe images must not be reused in other parts of the CMS or across brands.

Search Indexing Safegaurds

- If recipe images are publicly accessible at their image locations, the image URLs must return a header response `x-robots-tag: none` to prevent indexing by search engines

4. SEO

- Apply `rel="nofollow"` to all external links.

Legal Requirements

Legal Requirements

Criteria for Adding a Site

- Publicly available recipes with no login or paywall required
- Site is a recognized publisher of recipes (not just a user-generated forum or aggregator of unknown provenance)
- Domain ownership and reputation verified (no shady scrapers or mirror sites)
- Content format is technically compatible (structured recipe pages, not PDFs or screenshots)

Review and Approval Process

- Product proposes sites for safelist
- Legal reviews for copyright/terms-of-service red flags
- Final sign-off recorded with date and approver
- Documented in a central registry (spreadsheet, Airtable, or internal tool)

Ongoing Monitoring

- Quarterly or semi-annual review to confirm no paywalls, ToS changes, or new ownership
- Automated checks for paywall triggers if possible (flagging pages requiring login or subscription)
- Track takedown requests or complaints; repeated issues should trigger automatic removal

Display Rules

- Always show clear attribution: image, recipe title, domain, and link back to the recipe

Image Handling Requirements

- Recipe images scraped from third-party sources are stored using the UGC image service, not the database
- Images are cached on the CDN and rendered from the CDN on the frontend to avoid performance issues
- Recipe images cannot be reused in other parts of the CMS or across brands
- If images are publicly accessible, the CDN response must include `x-robots-tag: none` to prevent indexing by search engines

Removal and Opt-Out

- Immediate removal if site requests opt-out (voluntary or via DMCA/takedown)
- Removal if paywall is introduced or ToS explicitly forbids use

Monetization Guardrails

- Ads or shoppable links are allowed alongside clipped recipes only after explicit legal review
- No branded sponsorships attached directly to specific external recipes without consent
- Ongoing monitoring of whether commercial use introduces new risk

Disclaimers and User Terms

- Disclaimer: recipes come from third-party sources, and People Inc. does not guarantee accuracy or ownership
- Clear user-facing language that takedown requests will be honored promptly
- Legal disclaimers in user terms to limit liability for third-party content

Promotion Plan

Serving Up the Recipe Clipper: Our Marketing Game Plan

Content Type	Asset	Target Timing	Status	Owner
Homepage	Feature Promotion Block	w/o 12/8	in progress	Jeremy Chou Chantelle James
Email	New Feature announcement to existing MYR users	12/6	in progress	Riley Steffen
Social	New Feature announcement to existing social followers	12/5 then 12/10		Brooke Schuldt
Editorial	Content prom			Kristen Altmeyer
Customer Service	FAQ page	12/4	complete	Jody Freire

Homepage

- New feature promo block on homepage
 - Design reference: [Figma - MYR Homepage](#)
 - CTA drives to users' Saves page, where the saves flow block modal lives

Email

- Dedicated “New Feature” announcement email to existing MYR users
 - Send date: 12/6
 - Figma [here](#).
 - Primary goals:
 - Educate users about the new feature and value
 - Drive traffic to feature and encourage first use

Social

- Social promotion plan to be led by Brooke
 - Messaging, timing, and creative to be aligned in Friday’s marketing sync
 - Consider coordination with editorial content drop for stronger reach

Editorial

- Potential supporting content:

New Feature Coming Soon!

Save Recipes from Around the Web

Supported Save Recipe Sites

5 days ago · Updated

What is this feature?

You can now save recipes from 1,000+ supported food sites directly to your MyRecipes account. It's your one place to keep everything you love to cook, no messy bookmarks or screenshots to deal with!

To find out if your go-to recipe site is supported, check out the table below.

You can easily search the list by clicking the **magnifying glass** icon in the top right corner. If you'd like to see the list in a bigger window, simply click **"view larger version"** at the bottom of the table.

If your favorite food site isn't supported yet, [let us know!](#)

Fast Follows

🔗 FFT-170: Recipe Clipper Fast Follows

🔗 FFT-82: Update docId field to String type in Graphene and Resound

Breakouts -Meeting Notes

Jan 14, 2026 | Clipper -Discuss opening up scraper capabilities - postponed to late Q1

Agenda and notes

- Opening up scraper capabilities starting with internal articles that are not recipeSC
 - Internal articles
 - (from dec team sync) Turning it on for article schema is possible, not a technical limitation but opens it up to concerns around users bookmarking content that aren't recipes.
 - Handling sites that don't have the right recipe meta data

Jan 8, 2026 | Clipper Phase 2 - next steps

Agenda and notes

- Scope of phase 2
 - MYR recipe template
 - Add a Recipe form
 - Chantelle James targeting to complete PRD with updated requirements by EOW 1/9
 - Stakeholders sign-off early next week
 - Design/Mocks
 - OCR -

Next steps

- User testing + stakeholder sign-off - week of Jan 12

- Bithika Adhikary to connect with Chantelle James Andrea Watson next Thurs 1/15 to check in on progress for Designs/signoffs
- Team kick-off/LOE/Task breakdown - 1/20 - Bithika Adhikary to schedule.

Jan 7, 2026 | Clipper working session - scraper handover

Recording:

https://dotdash.zoom.us/rec/share/PChOqNi4yM_qjMKswx2CZqGQK6cxdANKRdkW5sVZygnDnv1x4T-GnwYfNJA1Irs6.HIU-Rw7s6jBfZnVr?pwd=DJCBTomAHj1hVviMPwAAHgAAAI4fCQiXPMRyoElh_H8FA5LeTSoZHUSJlNy2EJBQ0zl1EZPLWJ4GMPgV2LVEXiMwMDAwMDQ

Agenda and notes

- Review code
 - Serverless.yml
 - recipeScraperService.js
 - runParallelScrape
 - chromium
 - curl
 - Unit tests
- Local development testing
- QA
- CI/CD Process

Dec 8, 2025 | Clipper - Discuss LOE+ release plan for Update docId field to String type in Graphene and Resound

- [Initiative link](#)

Agenda and notes

- Update on spike for Resound Templates/Services that will need to be updated
- Team estimates /LOE/ release plan
 - Graphene

- The template switch could cause problems but should not result in downtime if handled properly through a spike. Confirmed that external recipe Elasticsearch queries would be indexed as strings.
 - Review in Jan after the spike is done
 - Food flex 2
 - Mantle BE
 - Resound BE
 - Updates on LOE after the Spike tickets for teams are completed.
 - Data services
 - Needed for bulk update
- Release plan - revisit in Jan
 - QA leads - Sana and Erickka

Action items

- ☐ Team regroup in Jan once the Spike/Investigations are complete - Bithika Adhikary to schedule
- ☐ @abubakr.sharif to connect with Jian on timeline for Graphene team to start the Spike and estimated timeframe for completion.
- ☐ Todd Breiholz to add an Epic for the data services team to cover the bulk update work for external recipes. Also add a verification ticket to the Epic to confirm that migration scripts and live syncs do not need changes due to the doc type ID update.

Dec 1, 2025 | MYR Clipper -Team sync

Agenda and notes

- Recipe Clipper QA & UAT Validation Tracker
 - Moderation service does not support webp image format resulting in error msg for user- fast follow
 - Error - Recipe not found error msg when recipes doesn't have an image
- Discuss the process for adding a site to the safelist (<https://thefeedfeed.com/>)
 - Safelist is managed in Selene, Luke can help with this (Fast follow)
 - Test site in QA before adding to Prod safelist
- Slack message for editorial workflow of adding primary images related to this bug
 - 📎 FFT-198: Internal Recipe: Brand fallback Image not displaying in collections modal (<https://dotdash.slack.com/archives/C01RTM62KAQ/p1764616474004949>)
 - Post launch for Edit
-

Action items

- ☐ Luke Pierotti to review the [UAT error logs](#) and prioritize as needed.

- ☐ Chantelle James to add a ticket for adding Feedfeed to the safeList (post launch)
- ☐ Jeremy Chou to connect with Vijay about allowing recipe clipping without images for external sites
- ☐ Jeremy Chou to connect with Vijay to add new headers to scraper to resolve Food Network blocking issues
- ☐ Erickka Dominguez to update pre-QA ticket with screenshots and links from PE regression testing

Nov 21, 2025 | MYR Clipper -Team check-in

[MYR Clipper Jira roadmap](#)

Agenda and notes

- Team updates
 - Data services
 - Error rate on scraper at 7.5%, what is an acceptable error rate for launch?
 - Chantelle to check with Mango on acceptable threshold for mvp launch
 - Explore pre-saving recipe options post launch
 - Graphene
 - Status on docId skipping? Possible impact to launch date
 - Jill Kramer to provide test of skipping summary by Monday to determine if launch blocking
 - FE and Mantle
 - Flow working on FE and in testing running into some issues but will know by EOD w/ a test environment
 - Sana will begin all testing (dev and E2E) on Monday
 - Resound BE
 - Complete!
 - CPI - <https://dotdash.atlassian.net/browse/CPI-10525>
 - Raised the API gateway setup with Leon and Vivek
 - [Slack thread](#) and Jira ticket
- QA Plan

- Mantle + mm-myrecipes changes
 - These require running regression with and without the configs turned on for clipper on multiple brands
 - How do we want to split up this work?
 - Testing focus
 - Get prioritized list from Growth for QA

Nov 13, 2025 | External Recipe API

Doug Brown Luke Pierotti Peter Weckend Bithika Adhikary Chantelle James

- flow between mantle and resound:
 - user clicks save
 - mantle makes a call to resound to check if recipe exists in graphene, returns true or false
 - if true
 - mantle makes call to resound to save bookmark using md5hash
 - if false
 - scrape recipe and get data
 - mantle makes call to resound to create recipe in graphene
 - mantle makes call to resound to save bookmark using md5hash
- other considerations:
 - if multiple people are saving a recipe at the same time (i.e. if the recipe already exists in graphene), then the calls to resound create data in graphene will always succeed, returning a 200
 - no change to delete bookmark endpoint, it will continue to accept a docId

Nov 6, 2025 | Discuss Clipper response time and next steps

- Audit of competitor performance for *brand-new recipe saves*.
 - See column z: [📄 Recipe Clipping Competitive Features Comparison](#)
 - Based on my audit, there doesn't seem to be that much of a difference when adding a new recipe. I tested around 10/11 AM est and recipes had been published same day, so they had only been live for a couple of hours
 - Summary: Most competitor apps load recipes in **2–5 seconds**. The fastest (like Mealtime, Flavorish, RecipeBox, and The Kitchn) load in **2–3 seconds**, while

slower ones (like Food Network and Deglaze) range **5–8 seconds**. Our scraper runs **2–9 seconds**, competitive when warm but slower when cold-started.

- Option A: Keep as is — average performance, sometimes slow, but in line w/ competitors.
- Option B: Preload recipes — faster and consistent (<4s) but adds complexity and delays launch.
- Option C: Async save — shows users their recipe is processing, improving clarity, but still delays launch.
- Discuss scraping options A, B, C
 - **Decision to move forward with Option A**
 - Review and update FE design load message and eng LOE Aleza Leinwand Douglas Tschetter
 - Event tracking for the existing modal while the recipe process is loading Chantelle James to reach out to Farris Bienstock
- Phase II: Parallel path presave top recipes for high traffic times Zachary Mills Jeremy Chou

Action items

- ☐ Data services to update scrape times of urls that had a 500 response by tomorrow - @vijay.k
- ☐ @Chantelle to connect with @Doug Tschetter on FE estimates for dev work for loading modal
- ☐ @Aleza Leinwand to work on design polish and copy updates
- ☐ @Chantelle to work with @Farris Bienstock to ensure we have visibility into any user dropoffs
- ☐ @Zack Mills to provide an update list of the top 10k most saved recipes
- ☐ @Bithika Adhikary to schedule a breakout for teams to discuss the build of the service that will ingest the top 10k recipe URLs through the scraper and save in Graphene.

Options for Recipe Scraping (Performance)

A. Continue as Is

Current State

- Response times range from 2–9 seconds
 - Lambda cold start: ~3 seconds
 - Site loading, scraping, and processing: 3–4 seconds
 - Warm Lambda: 2–3 seconds total

- Worst case: 9 seconds (cold start + slow site)
- Best case: under 2 seconds (warm + fast site)

Notes: Data Services is identifying what % of the safelist experiences delays. Performance is comparable to some competitors (e.g., Food Network).

Pros: No additional scope. Launch remains on track for 12/4.

Cons: Slower user experience.

Technical Work: None required.

Add cost to warm system?

B. Presave All Safelist Recipe URLs

Overview: Preload recipe URLs for faster load times (target <4s). Requires ingesting ~1,400 domains × recipes per domain and a new service to feed URLs into Graphene/Bookmarks APIs.

Pros: Faster perceived load through caching.

Cons: Expands scope and maintenance, requires new backend process, may delay launch, treats symptom not cause.

Technical Work Required

- Scraper must be fully completed <https://dotdash.atlassian.net/browse/DS-3936>
 - Outstanding moderation endpoints need to be finished and released
- Resound mutation endpoint must be completed <https://dotdash.atlassian.net/browse/FFT-27>
- Then we need to create a process that runs all recipe urls through the scraper, the mutation endpoint, and saves it into Graphene
- In terms of technical effort, the LOEs for completing the scraper service and moderation service should remain the same and are already included in the original project scope.
- The **additional work** is primarily the last item — creating the process that runs all recipe URLs through the scraper, mutation endpoint, and saves them into Graphene.
 - FFT or Data Services
- We'll need to get estimates from the respective teams for that step, but it may still be feasible within the current timeline, pending LOEs.
- Zachary Mills to pull Top X (100?) recipes from each domain to feed into the pre-save bulk process

Timeline Impact: Extra engineering for the process step; estimates needed from teams.

Possibly still feasible within current timeline pending LOEs.

C. Async Save Flow

Overview: User sees “We’re processing your request to save the recipe...” while system scrapes in the background, then notifies when complete.

Pros: Safest UX; sets clear expectations; handles long loads transparently.

Cons: Requires frontend updates; delays launch; not always fastest experience.

Technical Work Required

- Scraper must be fully completed <https://dotdash.atlassian.net/browse/DS-3936>
 - Outstanding moderation endpoints need to be finished and released
- Resound mutation endpoint must be completed <https://dotdash.atlassian.net/browse/FFT-27>
- FE work to display async processing message to user
- FE work to display “save is complete” message to user, based on a trigger event
- Create a workflow on the BE to trigger the scrape, save into Graphene, and then notify the FE to signal to the user that the save is complete - need to loop in another team: Core Workflow team
- Possibly moving the Lambda scraper code into Temporal worker to function within the Temporal workflow

Timeline Impact: Additional coordination and build time.

Additional Notes from Engineering:

- In all scenarios, any new saves of brand-new recipes will have the same performance as Option A.
- Before presenting this to stakeholders, we need a full audit of competitor performance for *brand-new recipe saves*. The current metrics can't be used as a direct comparison since they're likely from recipes that have already been saved.
- Early testing shows that Food Network takes around 8 seconds to save a brand-new recipe. We need to establish a clearer performance benchmark before final recommendations are made.

Nov 5, 2025 | Customer Service

- Jake Melssen found an airtable solution to display safelist!!
- Chantelle James to provide final FAQ copy to CS by EOW

Nov 5, 2025 | Discuss Recipe Clipper scraper timeouts

- Have been able to reduce the time outs and load timing
 - Still cases where recipes take 6 seconds
- Of the 1,444 unique domains, which ones met past performance thresholds?
📌 Recipe Scraping (10/31/25)
- Propose saving the safelist within the scraper to help prevent loading issues. Any recipe sites on the safelist that add new recipes after the initial run would be re-run once or

twice a year to capture newly published content (open to discussion). -

Chantelle James

- Growth to provide a list of all recipe URLs across the 1,800 unique domains
- Build a service to feed recipe URLs into the Graphene - this is the Bookmarks APIs.
- If the Bookmarks API cannot scale effectively, explore a Data Pipeline alternative to load the pre-saves into Graphene
- Prerequisite: Moderation must be in place.

Nov 3, 2025 | Recipe Clipper UI and Scraper

- Performance of the recipe scraper and whether frontend user experience needs to change to accommodate potentially lengthy requests
 - [Slack thread](#)
 - Slow scrapping/errors are frequent enough that we would not launch with the current experience
 - Investigate root cause of timeouts Vijay Karthick Palanisamy Todd Breiholz
 - Memory bump for lambda to see if that will help
 - Next steps
 - Connect with Todd and Vijay by Wed 11/5 for an update on timeouts

Oct 27, 2025 | MYR recipe clipper - safelist qa automation

-  recipe_clipper_safelist.xlsx
- Eng / Growth schema reqs for scraper
- Data Services dependencies

Next Steps:

Growth needs top recipes for each domain

Oct 15, 2025 | MYR recipe clipper - handling docIds for external recipe

- number route -
 - Time efficient

- type change - String
 - Graphene schema, RSND template, API, hash Urls > docid
- Flag in Graphene for external links
 - Boolean for external

Next steps

- Luke Pierotti to outline the technical direction for the numbers option for Dec release
- For the type change to string, we will look at looping in Graphene, resound and Food teams, CTP or async CTP Luke Pierotti Bithika Adhikary to coordinate to schedule this for later this year/Q1

Oct 9, 2025 | MYR recipe clipper - Discuss Dec launch options

- Feasibility of Dev completion by Nov 21
- Review the QA+UAT timeframe
- Feasibility of an early December launch (Dec 2-8)
- Do we need another Resound dev for a sprint to complete some blocking work?
 - <https://dotdash.atlassian.net/jira/plans/2918/scenarios/2987/dependencies>
- Weekly syncs for this launch ?Yes

Oct 3, 2025 | MYR recipe clipper -discuss roadmap and release plan

Agenda and meeting notes

[Link to roadmap](#)

- Review team estimates and team start dates for MYR Clipper
 - Design
 - Oct 6 still the target for hand-off to team?
 - Targeting Oct 10 for handoff to dev.

- Design feedback is in progress. FE dev work will not be impacted by 10/10 design delivery.
- Data services
 - No dependencies to start
 - <https://dotdash.atlassian.net/browse/DS-3936>
 - Check in with Todd on ETA for overall epic completion timeline <https://dotdash.atlassian.net/browse/DS-3948> is blocked by <https://dotdash.atlassian.net/browse/GRP-3515>
- Flex 2
 - FE MYR clipper
 - Resound BE - 3sprints ..Tentative due date - 11/8 (sprint 23)
 - Mantle BE
 - FE+ Mantle- 4-5 sprints
- Selene - work to support safelist for clipper
 - <https://dotdash.atlassian.net/browse/GRP-3515>
 - A week to get to QA, targeting 10/15- 10/17
- Infra
 - CPI Ticket needed for image service/terraform update to support no robot indexing
 - [Slack thread for context](#)

Action items

Oct 3, 2025 | MYR recipe QA leads regroup

- Review team estimates and team start dates for MYR Clipper
 - QA
 - Auto
 - UAT
 - Target launch date
 - Regroup on this once we have the dev completion timeframe. Leads breakout scheduled for 10/6 to discuss resourcing and ways we can optimize the timeline for Q4 launch
- Sabreen is adding this !!
 - Definition of a valid recipe url and invalid recipe url
 - What types of recipes would have strict provisions that would restrict it from being saved with clipper?-- trying to understand limitations and how to test this.
 - Is there a safelist for this?
 - How important is the error messages validation, word by word validation needed?
 - Clarification on the duplicated message workflow needed.

- QA - LOE- 8pt
 - 10 days for testing and bug fix
- Holiday code freezes
 - A few days before major holidays

Sep 15, 2025 | Legal Reqs

1. Are we permitted to cache images locally, or must they always be pulled directly from the source?
 - 1b. Are we permitted to cache images on our CDN?
2. If cached, how long can images be stored before they need to be refreshed or deleted?
 - a. Recommended cash storage timeframe from eng
3. Do we need to display attribution (photographer or source site) when showing clipped images?
 - a. Yes, need grey text w/ source name below image Jenn Bishop does the attribution need to be everywhere we display the image, or can it just be in the quick preview? (photo credit source title, not like from name)
4. Legal disclaimers: your user-facing terms should clarify that content comes from third-party sources?
5. What is our process if a site files a DMCA takedown request? Who handles compliance, and within what timeline?
 - a. Chantelle to follow up with Resounds process
6. Monetization guidelines?

Action Items

- ☐ Julia to provide caching guidelines by tomorrow
- ☐ Eng cache recommendations
- ☐ Update terms and conditions before launch
- ☐ Aleza update mocks with display attribution

Sep 9, 2025 | Tech breakout -MYR Clipper (contd)

- [Initiative link](#)

Agenda and meeting notes

- What will be the brand association for these 3rd party recipes in Graphene so that FE can render the appropriate attribution (are we going to create a placeholder brand in Graphene?)
 - Recipe brand/source - for 3rd party - Name and text , logo not required.
 - Predetermined list can be used
 - i. Where do we get the name from ? - check with Legal for using name of source as attribution Chantelle James
 - ii.
 - For external sites we will not not show ratings
 - Safelist with a domain category assigned
 - i. Show a list for users to save from ? Chantelle James Aleza Leinwand
 - ii. Curated lists can define mappings
- Data management
 - Do we have the foundations to support this feature at scale?
 - i. Use lambda for scaling options
 - Handling malicious behavior
 - i. Scraping security concerns. since we're scraping data from any URLs that users drops in, need to consider protection against malicious data injection to Graphene
 - ii.
 - How do we ensure the data we are saving is not garbage that will create issues down the line?
 - i. Will be handled by the safelist domains
 - External site changes or 404 updates
 - i. [PRD info link](#)
 - ii. **MVP – User responsibility:** Do nothing in the background. If the link is dead, the saved card still shows title and image, but the external link fails. It's up to the user to unsave it.
 - How are the external brands represented in the collection tile cards?
 - i. Curated list mapping, name/time no ratings
- Resound safeguards
 - Block explicit images or offensive language.
 - i. Can this happen in the scrapping?
 - 1.
 - ii. How long will the validation take?
 - iii. Event driven background process
 - 1. Fairly quick for user
 - 2. Title, image and url validation only
 - iv. Check with legal on language and user exposure for this– Chantelle James follow up with Jen
- Auto moderation with manual moderation with override (later not MVP)

Ideally want the user to be able to save immediately, but this answer will determine UX

- i. If processing takes longer than x seconds, display a loading symbol
Aleza Leinwand Chantelle James
- Saving data for indexing
 - Do we need to refactor Bookmarks API to decouple from doc ids? **Yes**
 - i. Currently we use bookmarks which is linked to docids
 - ii. Does this need to be done for MVP ?
 - iii. Will need Axis support, may be consulting given current Food team structure
- Data services
 - DS team is looking to implement a reusable codebase for scraping can be shared across initiatives
 - i. Specifics fields that will be scraped will vary depending on whether its Food or TRX Moonshow
 - ii. [Link to DS Scraper repo](#)
 - iii. [2nd Link to product scraper repo](#) (requires Github access)

Action items

- ☒ ~~@Chantelle to check with Legal on using the source name for attribution~~
- ☒ ~~@Chantelle and @Aleza Leinwand to discuss if we want to show the users a list of predefined domain options from~~
- ☒ ~~@Chantelle and @Aleza Leinwand to look into if processing takes longer than x seconds, display a loading symbol/appropriate messaging~~
- ☐ @Jeremy Chou to share the link of the second scraper repo that we can potentially leverage for this.
- ☐ @Bithika Adhikary to schedule a Feature planning+ LOE estimation meeting for next week so we can start building up a roadmap for delivery.
- ☐
- ☐

Sep 4, 2025 | Tech breakout -MYR Clipper

- [Initiative link](#)

Agenda and meeting notes

- Searching and indexing
 - Will the MVP include the ability to search on these 3rd party recipes? search
 - within collections? limited to title and description search
 - Not for MVP - May be handled by the Food search and discovery team at a later time.
 - i. it's a shared search component/logic, so we can't have recipes show up in personal search and not in public search
 - How do we save the data in a way that it can be indexed and searchable in myrecipes?
 - i. Do we need to refactor Bookmarks API to decouple from doc ids? **Yes**
 1. Currently we use bookmarks which is linked to docids
 - Graphene only data is an option.
 2. Move to using urls?
 3. Parking lot for next discussion
 - **3rd part recipes bookmarks will NOT show up on MYR homepage search and is not searchable on personal collections either**
- Recipe scraper
 - Will the web scrapper need to bypass paywall for recipe scrapping? - Not MVP
 - i. List of domains what we can bookmark recipes from ?
 1. FE can use a predetermined list of recipes domains, faster response times for end user
 2. Preference
 3. Product to develop this list Chantelle James Jeremy Cohen
 - ii. Service will need to figure out how to handle paywall content
 1. If paywall - delay for a few min and messaging
 - iii. Decision - **Team leads aligned on Option 1.** Chantelle James Jeremy Cohen to help develop the list of preferred domains where users can save urls.
 - Scraping security concerns. since we're scraping data from any URLs that users drops in, need to consider protection against malicious data injection to Graphene.
 - i.
 - will we be storing the external site's recipe image or just referencing their image? this may be a good use case to leverage the image service to cache the image for serving on our site (may need to update the image domain)
 - Will the scraper be able to bypass bot protections on third party sites?
 - i. POC for commerce done by DS team

1. Will be repurposing this - <https://dotdash-meredith.sourcegraphcloud.com/bitbucket.prod.aws.about.com/DSV/data-pipeline-pdf-export>
- ii. Majority will be new development
 1. Share existing poc doc with other team leads **Jeremy Chou**
- Scraper
 - i. 3 fields from schema
 - ii. Image url + title -> recipe URL -
 - iii. Image url - instead of downloading, use image service to cache image to CDN serve images up to a Year, determine TTL for storage
 1. Rights for image
 - Check with Alison on image/Legal
 - Email to Jenn legal agreements **Chantelle James**
 2. Same as AR UGC images, use Infra image caching service
 -
- Team to build the scraper
 - i. DS (possible option)
 1. Leverage lambdas - cost effectiveness as its not always running
 2. Leverage lambda Security benefits - ephemeral and isolates/contains the attack vector
 3. TRX Product scraper - possibly Q1
 4. Future state - leverage open AI, insta
 5. User experience -
- What will be the brand association for these 3rd party recipes in Graphene so that FE can render the appropriate attribution (are we going to create a placeholder brand in Graphene?)
- Data management
 - Do we have the foundations to support this feature at scale?
 - Handling malicious behavior
 - How do we ensure the data we are saving is not garbage that will create issues down the line?
 - External site changes or 404 updates
 - How are the external brands represented in the collection tile cards?
- Resound safeguards
 - Block explicit images or offensive language.
 - i. Can this happen in the scrapping?
 - ii. How long will the validation take?
 1. Ideally want the user to be able to save immediately, but this answer will determine UX

- If processing takes longer than 3 to 4 seconds, display a loading symbol

Action items

- ☑ ~~@Chantelle @jeremy.cohen to collaborate on the domain list for recipes to bypass paywall~~
- ☑ ~~@Jeremy Chou to share details of the POC for a Commerce scraper that Data services has built previously.~~
- ☑ ~~@Chantelle to connect with @Jenn Bishop from Legal on caching external images for a period of time~~

Sep 4, 2025 | MYR Clipper

Bithika Adhikary Chantelle James Luke Pierotti

- [Initiative link](#)

Agenda and meeting notes

- Need to refine how we'll pull the data when scraping, and how we determine if a site is a recipe
 - **DS team to handle?**
- Concerns about saving data from external sites - Tech breakout (Selene, Graphene, Axis, Resound)
 -
 - how do we ensure the data we are saving is not garbage that will create issues down the line?
 - How do we save the data in a way that it can be indexed and searchable in myrecipes?
 - Do we need to refactor the Bookmarks API to decouple from doc ids?
 - Currently, we use bookmarks, which is linked to docids
 - External doc > selene doc id or do we decouple this from doc id
- Data management - do we have the foundations to support this feature at scale?
 - Handling malicious behavior

- If ext site changes images , 404
- Handling recipe page does not have the expected schema data
 - Only allowing saves from sites that do have the data ?
 - Many sites do not use Recipe schema, so we'd need to be able to handle pulling the data from regular schema
 - Src, image , title, url
 - Chantelle James to collaborate with Growth Rachel Ullstrom
- Safeguards when saving content from external sites
 - Can we leverage resound safeguards for UGC?
 - Check with Michelle Osborne on this - Bithika Adhikary
- Map out potential error situations
 - Userflow - Aleza Leinwand to help with design + Chantelle James
 - Loading screen while data is being fetched
 - Chantelle James Luke Pierotti to map out the technical error scenarios
 -
- Connect with TRX Moonshot ?
 -
-

Teams so far ([from CTP thread](#))

- Graphene - data storage
- Data Services - if the web scrapping service is not being built by another team
- CDP - if the MVP requirements includes the ability for users to search on these external saved recipes
- Flex 2 - Front-end

Next steps/Action items

- ☒ ~~Tech breakout for discuss external data storage and data management - Bithika Adhikary to schedule~~
- ☒ ~~Recipe schema and how we do we handle sites that don't have a recipe schema - Chantelle James Rachel Ullstrom to collaborate~~
- ☒ ~~Map out potential error situations - Chantelle James Aleza Leinwand Luke Pierotti~~
 - ☐ This will follow the recipe schema discussion with Growth
- ☒ ~~Check which team will be helping data seraping build Bithika Adhikary~~

Weekly sync - MYR Clipper

JIRA Initiative [🔗](#) FFT-1: MyRecipe Recipe Clipper

Technical Notes

[📄](#) Recipe Clipper - PRD

[🔗](#) <https://dotdash.atlassian.net/wiki/x/qIC1WQE> - Can't find link

Jira Roadmap [🔗](#) <https://dotdash.atlassian.net/jira/plans/2918/scenarios/2987/timeline?vid=5262> - ...

Post launch Jira roadmap -

<https://dotdash.atlassian.net/jira/plans/5784/scenarios/5853/timeline?vid=8335>

Jan 21, 2026 | Weekly sync -MYR recipe clipper Post launch

Agenda and meeting notes

- [Update docId field to String type in Graphene and Resound](#)
 - Team updates
 - Graphene
 - Updates later this week on the spike ticket for the team. The team was busy with Sprint 0 tickets thus far. Check with Jill/Jian by end of the week.
 - Jill noted the need for two different templates when working with Graphene instances and agreed that QA testing could be done in separate environments - a seamless transition would not be possible until their issues are resolved.
 - Mantle updates
 - FoodFlex team's work is independent of changes in graphene and Resound
 -
 - Resound updates
 - Spike for Resound is progressing well. Kevin estimated 1-1.5 tickets that can be tentatively completed by sprint end 2/3.
 - Jill noted that updating templates is blocked by a graphene ticket that requires changing integer doc IDs to strings, and Jian is working on finding a way to transfer templates while maintaining compatibility with previous versions.
 - Data services
 - Most of the DS work would begin after other team tickets are completed, with a dependency on schema updates. (<https://dotdash.atlassian.net/browse/GRP-3705>)

Next steps

- Bithika Adhikary to connect with Graphene team for an update by EOW
- Discuss any dependencies on docID change prior to Clipper Phase 2 - Luke Pierotti to review at upcoming technical implementation discussion next week
- Kevin Walch to add the other tickets for Resound work

Dec 17, 2025 | Weekly sync -MYR recipe clipper Post launch

Agenda and meeting notes

- Handover of scraper from Data services to Food flex 2 - next steps
 - Working session with DS and FFT - pick this up in Jan
 - Todd to add documentation
 - Repo access for Food flex 2 (bitbucket)
 - Repo access list for Todd
- Update from Data services on scraper improvements
 - User attempts to scrape site that are not recipes/RecipeSC or don't have the right metadata
 - Discuss approaches in Q1
 - Turning it on for article schema , not a technical limitation but opens it up to concerns around users bookmarking content that aren't recipes.
 - Team breakout in Jan , start with internal articles with recipes that users cannot currently save.
- Moderation failures
- Error saving from food52, issue with Vercel's bot checking
 - Chantelle James to ask CS to remove from safelist for nowc
- Performance, responsiveness around 3sec, moderation requests were taking up to 4-5 seconds
 - Luke to add a ticket for additional investigation

Action items

- ☒ ~~Todd Breiholz~~ to add scraper documentation for Food team
- ☐ Luke Pierotti to send the list of Food dev to Todd that will need access to scraper repo
- ☒ ~~Bithika Adhikary~~ to Schedule working session for DS and Food Flex 2 to review scraper handover
- ☒ ~~Bithika Adhikary~~ to schedule breakout with Food flex 2, Data services and Growth to discuss opening up scraper capabilities starting with internal articles that are not recipeSG
- ☐ Luke Pierotti to connect with Kevin Walch on moderation failures and any possible improvements
- ☒ ~~Luke Pierotti~~ add a ticket to investigate and improve moderation performance
- ☒ ~~FFT 304: [SPIKE] Investigate Image Moderation Performance~~
- ☐ Chantelle James to ask Customer Service to remove food52 from safelist due to errors while scraping
- ☐ Todd Breiholz to update the group on the private endpoint setup and the rate limiting ticket once the deployment issues are addressed. ([CPI-10525](#) and [BULK-403](#))

Dec 10, 2025 | Weekly sync -MYR recipe clipper Post launch

Agenda and meeting notes

- Update from Data services on scraper improvements
- Handover of scraper from Data services to Food flex 2
 - Add IT helpdesk ticket for Luke and team, requesting AWS Account Access - Developer Role Access to:
 - **MDP - Commerce - Platform - Production** 152962632001
 - [Slack thread for context](#)

Nov 25, 2025 | Weekly sync -MYR recipe clipper

Agenda and meeting notes

- Blocked on testing - cannot connect to scraper anymore
 - Seeing connection errors in testing due to issues with the scraper endpoint in Kibana.
 - Next steps
 - Revert back to public cloud option to unblock testing
 - URL and API key should not change but Todd will let the team know.
 - DS will setup a separate instance in private cloud to investigate the issue in parallel with team continuing to test using the public option
 - Update channel in the next hour- Todd Breiholz
- Review [open defects in Bug tracker](#)
 - <https://dotdash.atlassian.net/browse/FFT-167>
 - Review after environment is available later today and move to STAR board if still an issue. Not launch blocking but will be good to fix before launch day.
- QA e2e update
 - Testing was progressing well. Sana Khan is planning to focus on event tracking and prioritize testing 50 top recipes.
 - Sabreen Mostafa noted an issue with an automation script used by Stardust for managing recipes under user accounts. Manual operation would be challenging for running tests, though it is not a launch blocker.
 - Sabreen is working with Oleg at resolving the recipe Automation Script Issue before launch. (not launch blocking)
- Automation for Resound
 - Can be done post launch
 - <https://dotdash.atlassian.net/browse/FFT-175>
 - <https://dotdash.atlassian.net/browse/FFT-176>
- UAT
 - Timeframe 11/26 - 12/2
 - Chantelle is aiming to send this out by tomorrow, pending environment availability for testing.
- Axis coverage for 12/4- Peter is OOO, checking on coverage
- Infra support for launch day

- Norman is OOO on 12/4. Reached out to Norman for an alternate contact.
- Clipper Post launch work moved to [FFT-130: MYR Clipper Post Launch](#)

Action items

- ☐ [Todd Breiholz](#) to keep the channel updated on next steps to unblock e2e testing (Revert back to public cloud option to unblock testing and also parallelly setup of private cloud instance to investigate the connectivity issues)
- ☐ [Sana Khan](#) to focus on event tracking and prioritize testing 50 top recipes.
- ☐ Sabreen to collaborate with Oleg to resolve the recipe Automation Script Issue (not launch blocking

Nov 19, 2025 | Weekly sync -MYR recipe clipper

Agenda and meeting notes

2 WEEK HOME STRETCH!!

- Team updates
 - Data services - 3 remaining tickets pending, tbd on timing
 - [BULK-333: Integrate with moderation service](#)
 - [BULK-332: Add a domain allowlist](#)
 - [BULK-318: Switch from library to Lambda](#)
 - Graphene
 - [Jeremy Chou](#) [Jill Kramer](#) to add QA refer allow list ticket to epic <https://dotdash.atlassian.net/browse/GRP-3573>
 -
 - Resound BE - 3 remaining tickets targeting EOD completion
 - <https://dotdash.atlassian.net/browse/FFT-29>
 - <https://dotdash.atlassian.net/browse/FFT-28>
 - <https://dotdash.atlassian.net/browse/FFT-31>
 - FE and Mantle
 - [Jesse Calton](#) working on MYR homepage feature block

- Not for launch, Chantelle James to create as fast-follow
 - Full completion by 11/21 is a maybe. Sync at end of day in channel if timing is not likely
- QA
 - Erickka Dominguez supporting tasks for Sana Khan entirely on testing. End to end link will most likely be available on Mon 11/24.
- Customer Service
 - Timing of FAQ and airtable safelist - need URL for eng. Chantelle James requested here [slack](#)
 - Airtable link
<https://airtable.com/appJmTBnpve2Vjl8p/shriFteHtNjzztjDD>
 - FAQ article/tile is ready to be made public on launch
- Marketing
 - Chantelle James to follow up w/ Amber Reichert on plans
- Concerns/Risk around Timeline  Miro
 - 11/21: FE/Mantle dev complete,
 - 11/24 QA kickoff (ends 12/2)
 - 11/26 UAT kickoff (ends 12/2)
 - 12/3: Go/No Go Bithika Adhikary set up mtg invite
 - 12/4: Launch
- Next Steps
 - Chantelle James send UAT kick off email Fri, will need a test link
 - Bithika Adhikary Chantelle James to work on launch/roll back plan

Upcoming Holiday Season Release Guidelines

Thanksgiving 2025:

Holiday Dates: Thursday, November 27th & Friday, November 28th

Release Dates:

Release: Monday, November 24th

Buffer: Tuesday, November 25th

Revenue Impacting Only: Wednesday, November 26th

Christmas and New Year 2025/2026:

Holiday Dates: Wednesday, December 24th to Friday, January 2nd

Release Dates:

Release: Wednesday, December 17th

Buffer: Thursday, December 18th

Revenue Impacting Only: Friday, December 19th or Monday, December 22nd

Nov 12, 2025 | Weekly sync -MYR recipe clipper

Agenda and meeting notes

- Team updates
 - MVP launch
 - Modal for loading delays - design + copy - Done
 - FE tickets added done! Chantelle
 -
 - Data services
 - Updates on the scrape urls that were returning a 500
 - [Sheet link](#)
 - Updating over night 11/12 ready tomorrow
 - Zachary Mills to final approve mvp safelist
 - Graphene
 - Image service update
 - Should we ready for testing later today. Jill Kramer to share test info on channel 11/12
 - Resound BE
 - Update on recipe mutation work
 - Waiting for pr review. Doug is aiming to get his done by EOW.
 - This will unblock FE and Mantle work
 - FE and Mantle
 - No additional time needed for modal addition to FE dev scope

- Backfilling recipes
 - Pre-saving -Not part of MVP - fast follow
 - DS has a working POC for this -new fetch method , response time less than 1sec for the safelisted URL's

Nov 5, 2025 | Weekly sync -MYR recipe clipper

Agenda and meeting notes

- Team updates
 - Graphene
 - New image service is ready, but currently bottlenecked with an [infra piece](#) and locking down with referrer
 - Image service build: testing v3 services right now, next week discuss fallback if needed
 - Resound BE
 - Need updates from doug
 - Needs to fully merge schema into graphene (EOW tbd)
 - Flex 2
 - Blocked on Resound work
- Create a page with safelist (A–Z page with a search filter) - Chantelle James Jody Freire
- Need Scraper to return some data/message field that alerts us if moderation has failed

Next steps

- Performance testing 3rd party sites on brand new recipes/timing on clipping
Aleza Leinwand
- Growth to provide a list of all recipe URLs of the ~1400 safelist. One recipe from the ~1,800 list. Ask for this first Chantelle James
- Need a Service to feed all recipe URLs into Graphene/ Bookmarks APIs service 2
Chantelle James to follow up with Doug Brown
- Bithika Adhikary work on gathering end dates for tickets
- Chantelle James to layout 3 options for decisions on load times and how to move forward. Eng to provide LOE

- Luke Pierotti start conversation about responses with moderation fails
- Jeremy Chou provide domains that don't pass antibot measures from growths list

Oct 29, 2025 | Weekly sync -MYR recipe clipper

Agenda and meeting notes

- API gateway issues for the Lambda endpoint updates
 - DS is working on resolving the timeout issues
 - Resolved. Peter will async on remaining questions with DS team
- Discuss proposed solution to the Recipe Clipper image render service - Graphene team
Abubakr Sharif
 - <https://dotdash.atlassian.net/browse/GRP-3573>
 - New Image service will be added for Clipper.
 - Graphene team to review estimates at team refinement tomorrow and update group on feasibility for dev completion for image service by 11/14
- Infra updates for Terraform Rules for MyRecipes to support no indexing and 30 day caching is done (<https://dotdash.atlassian.net/browse/CPI-10156>)
- Testing for moderation service (text and image)
 - Loop in DS QA lead Vandana Harchand to help with this.
- Recipe safelist automation and validation - In progress
 - Product, Growth and DS
 - [Recipe safelist doc](#)
 - Next steps - Growth to review the external test URL links and outline schema requirements by EOW
 - Team regroup to review automation options once this is done. Targeting early next week.

Next steps

- Graphene to refine tickets for new Image service and discuss feasibility of dev completion by 11/14 to accommodate overall dev completion timeline by 11/21
Abubakr Sharif Jill Kramer
- Growth to update the team by EOW on the schema validation requirements for external urls ([Recipe safelist doc](#))
- @vharchand to assist with testing the Moderation API updates

○

Oct 22, 2025 | Weekly sync -MYR recipe clipper

Agenda and meeting notes

- What env is free for us to use for this feature?
- Team Updates
 - Design handoff
 - Feedback and copy updates are completed.
 - Data services
 - Update by EOW 10/24 once Vijay is back. DS Teams other Q4 priorities have impacted their bandwidth for Clipper dev work
 - BE
 - Doug to cover for Kevin when he is OOO
 - Kevin OOO - 10/26 - 11/17
 - Schema design is close to being finalized
 - Flex 2
 - Should be unblocked once DS teams scraper work is available in QA
 - Infra ticket for Terraform Rules for MyRecipes is ready for testing
 - <https://dotdash.atlassian.net/browse/CPI-10156>
 - Graphene
 - New work has been identified for the graphene team
<https://dotdash.atlassian.net/browse/GRP-3573>

Oct 15, 2025 | Weekly sync -MYR recipe clipper

Agenda and meeting notes

- Design sign-off update Aleza Leinwand
 - Flow is Signed off.
 - Copy sign-off targeting EOD 10/15
- Data services
 - Update and ETA for completion

- Without moderation - dev completion targeting 2 sprints - 11/4
 - Dependency on Resound image and text moderation API update work
 - Should have updates in QA in a week for Flex 2
 - Total 3 sprints
 - Targeting mid-Nov for dev completion
- Food Flex 2 update
 - FE blocked by final design.
 - Aleza Leinwand to update the Figma to be dev-ready by EOD 10/15
- Axis update
 - Bookmark v4 spike in process
- Implementation of (fake) doclds for external recipes- Do we need a tech breakout?
Yes
 - Timeline implications for changing docld type?
 - [Slack thread for context](#)
 - Blocking the resound schema work as well
- Resound BE
 - Any resourcing updates?
 - Connect with Michelle later on this.
- Discuss QA +Auto timeframe (11/24- 12/3)
 - Additional resources needed for QA
 - Availability for QA for Thanksgiving - Sana, Erickka, Sabreen (tentative),
 - Review Automation effort and resourcing options
 - Sana Khan and Sabreen Mostafa to check with other QA and Auto leads from other Food teams (Flex1, Myrecipes) to see if we can get additional QA resources to help for 11/24- 12/3.

Action items

- ☐ Aleza Leinwand to update the Figma to be dev-ready by EOD today, 10/15.
- ☐ Chantelle James to add the FE tickets for Flex 2
- ☒ ~~Sana Khan and Sabreen Mostafa to check with other QA and Auto leads from other Food teams (Flex1, Myrecipes) for additional QA help for Clipper e2e testing (11/24-12/3.) Sana, Sabreen to update by Fri 10/17.~~
- ☒ ~~Bithika Adhikary to schedule a tech breakout to discuss handling of doclds for external recipes~~

PRD OCR

1 OVERVIEW

1.1 Business Goals

- Make MyRecipes the go-to place for every recipe, driving engagement through support for personal and handwritten saves.

1.2 Product Purpose / Value Proposition

- Give users one home for all their recipes—online, handwritten, or original—accessible anytime.

1.3 Target Audience Profile(s)

- People who want an easy, central place to store and manage every recipe they care about.

1.4 Desired User Outcomes

- Users can add recipes manually or upload photos that auto-extract details, then edit and save them in MyRecipes.

1.5 Metrics of Success

- Growth in recipes saved per user
- Increase in active sessions tied to saving or editing recipes
- New user signups driven by “Save your own recipe” marketing

1.6 Potential Risks / Negative Impacts

- OCR errors – Misreads cause frustration. Mitigation: editable preview before save.
- Inappropriate uploads – Spam or offensive images. Mitigation: image moderation and reporting.
- Storage strain – Heavy uploads slow performance. Mitigation: file limits and compression.
- UX confusion – Too many save paths. Mitigation: one “Add Recipe” entry point with clear options.
- Copyright risk – Uploaded content not owned by user. Mitigation: updated terms of service.

1.7 Underlying Assumptions

- OCR accuracy meets acceptable threshold (85%+)
- Users will edit and confirm extracted text
- Backend and schema can support new recipe types
- Legal approves user-uploaded content

1.7 Dependencies

- OCR API or ML service integration
- Image upload and processing pipeline
- Moderation tools for user content
- Updated app and web UI
- Backend storage for user recipes

1.9 Target Time-Frame

- Q1 Dev Kickoff

2 KNOWN REQUIREMENTS

2.2 Phase 2

-  A MYR recipe
 - Objective: Deliver a consistent, responsive Custom MYR recipe page that distinguishes personal recipes from site content.
 - Scope: Custom MYR recipe page template.
 - Success: Consistent rendering, preserved user uploads, functional editing.
 - Template Requirements:
 - Edit CTA
 - Directs users to the form
 - Recipe Metadata
 - Recipe Name displayed as primary headline
 - System metadata includes source, which indicates who the recipe comes from and is displayed as “Recipe By”
 - Last Updated Date
 - Summary
 - Optional one paragraph description, hidden if empty.
 - Photo
 - Single primary photo displayed at the top when available, with a fallback image.
 - Image scales proportionally across devices.
 - CTA buttons for Save and Print

- The Saved button appears filled. If the user clicks to unsave and remove, the filled state is cleared, and the recipe is removed from the collection.
 - Print directs user to the print preview page to print.
 - Servings and Timing
 - Display the number of servings.
 - Display prep, cook, total, and additional time when present, supporting hours and minutes.
 - Display yield.
 - Ingredients
 - Ingredients header with a vertical list. Each ingredient is entered as a separate line. Ingredient sections are supported.
 - Directions
 - Directions header with steps displayed as a numbered list. Each step is entered as a separate field. Step sections are supported.
 - Notes
 - Notes header with free text input.
 - Coke Mode: Base toggle to keep the screen on
 - Ingredient adjuster is excluded from this phase, with future LOE to be defined.
 - Key States
 - Post moderation recipe rendering examples
 - Example A: Recipe with most fields populated
 - a. Render all submitted sections.
 - b. Do not show empty state messaging.
 - c. Use uploaded image when available.
 - Example B: Recipe with limited fields populated
 - a. Render only submitted sections.
 - b. Hide missing sections by default.
 - c. Show helper message at top only when recipe is mostly empty, defined as title plus 2 ingredients and 1 direction or fewer.
 - d. Use fallback illustration when no image is uploaded.
 - No UGC
 - Mobile and desktop responsive specs
 - Personal recipes are private by default and will only be visible to the creator in search. If the creator shares a recipe page link directly, the recipient can view the recipe page. This behavior is legally approved.
-
-  Add Recipe Creation Form
 - Objective: Enable users to create a recipe using a simple, consistent form that works across devices and generates a clean, standardized MYR recipe template.

- Success looks like
 - Users can complete and save a valid recipe
 - Saved recipes render correctly in the MYR template
 - Form enforces required fields and prevents incomplete saves
- Scope
 - This feature covers recipe creation form and warning pop-ups.
- Form Structure and Requirements
 - Recipe Metadata Inputs
 - Recipe Name (required text input)
 - Description (optional text input)
 - Recipe By (optional)
 - Primary Photo (upload is optional)
 - a. Allow for one image
 - b. Accepted formats: JPG and PNG
 - c. Max file size determined by platform constraints
 - d. No cropping or editing workflow
 - e. Images are uploaded and saved as provided
 - Servings and Timing Inputs (all optional)
 - Prep Time (user enters hours and minutes as two separate numeric fields)
 - Cook Time (user enters hours and minutes as two separate numeric fields)
 - Additional Time: Optional, repeatable entries for non-active steps. Each entry requires a time type selected from a predefined list. Chill Time, Marinate Time, Soak Time, Rest Time. And a duration entered as hours and minutes in separate numeric fields. Users can add and remove entries.
 - Number of Servings (numeric only if present)
 - Yield
 - Ingredient Inputs
 - One Ingredient is required to save
 - Structured input with one ingredient per field
 - Ingredient section headings are supported by colons (e.g., Sauce:)
 - Users can exit an ingredient field to remove it
 - Users can delete a section
 - Direction Inputs (optional)
 - Structured input with one step per field
 - Step sections headings are supported by colons (e.g., To Bake::)
 - Users can exit a step field to remove it
 - Users can delete a section
 - Notes Input
 - Cook's Note: optional
 - Free text, no formatting features. May be used for nutrition facts or tips

- Global save behavior
 - The Save Recipe button saves the recipe to the user's personal recipes
 - Save is available in two locations top right of the form and at the bottom
 - Save is enabled when a recipe name and at least one ingredient are entered. These are the only required fields
 - No preview state before saving
- After save
 - User is routed to the saved recipe view
- Exit Recipe
 - When a user attempts to exit with unsaved changes, display a confirmation message warning that changes will be lost.
 - "If you leave now, your changes won't be saved."
 - Provide options to cancel and continue editing, or save changes and leave.
- Delete
 - User-facing message to notify that data will be permanently deleted. "Are you sure you want to delete your recipe forever?"
- Legal disclaimer displayed at the bottom of the form, linking to the Terms of Service
- Moderation occurs before and after extraction.

● Image to Text Recipe

- Objective: Enable users to generate a MYR recipe from an image, reducing manual entry while preserving user control.
- Scope: Image upload or capture through text extraction and pre-population of the recipe template.
- Success: Users can create an editable recipe from a single image and recover from failures.
- Entry Points
 - User can upload an image from Photos, Files, or take a new photo using the device camera where supported.
 - Supported image types are JPG and PNG.
 - Unsupported file types will be disabled and not be allowed to upload with a warning message that lists supported file types.
 - Maximum file size follows platform constraints.
 - No cropping or image editing in this phase. Images upload as is.
- Key States
 - Modal Add Image: Empty state before image selection from Photos, Files, or Camera.
 - Modal Photo Library or Files: Selected image is displayed. User taps the checkmark to upload.

- Camera and Image Review: User reviews the captured or selected image, then chooses Use Photo or Retake.
 - Loading: Text extraction is in progress.
 - Extraction Success: Extracted text is mapped into the recipe.
 - Extraction Failure: Image text cannot be read or extracted.
 - Moderation Failure: Image is rejected during moderation.
- Error Handling
 - Use a default error message for failed uploads or extraction.
 - Include a clear CTA to retry or replace the image.
- Input and validation behavior
 - User must provide exactly one image, either uploaded or captured via camera.
- Extraction behavior
 - System attempts best effort extraction of recipe-related content, including title, description, servings and time, ingredients, directions, and notes.
 - Extraction accuracy is not guaranteed.
 - Extracted content is pre populated into the recipe template. If the user is not satisfied, they can edit the recipe using the standard edit flow.
 - Uploaded image is set as the Primary Photo.
- Loading State
 - Display a loading screen with animation.
 - This will be a screen without any controls because we can't cancel the processing easily if a user wants to exit or close the page. The backend processes will still run in the background and do all the proper steps, so we can't give them an option to close/stop the process.
 - If a user leaves the page or refreshes, everything will continue to run in the background and when they go to their saved recipes page their OCR recipe would be available if it finished processing.
 - If processing exceeds three seconds, transition to the Recipe Under Moderation state with messaging indicating the content is being reviewed for accuracy and safety.
- Post extraction flow
 - If processing completes within three seconds, the user is taken directly to the default recipe state.
- Moderation occurs before and after extraction.
- Mobile and desktop layouts
- Legal review required

● + Add New Recipe Modal Update

- Purpose: Entry point for choosing a recipe creation flow.
- Trigger: Launched from the Add New Recipe action.
- UI: Modal with title, close control, and three options.

- Save From Image, Save from Link, Add a Recipe.
- Behavior
 - Selecting an option routes immediately to the selected flow.
 - Closing the modal exits without side effects.
- Additional updates
 - Update the copy in the Saved Recipe block since the action now routes users to the Add New Recipe modal, where they select Save from Link, Image, or Recipe.
 - Quick View Modal remains consistent with external code

Tracking Framework

Primary Metric

Number of saved personal recipes

Secondary Metrics

Creation attempts by entry point

Image processing load time

Image extraction success rate

Moderation approval rate

Post creation engagement actions

Tracked Events by Flow

- Creation Entry Points
 - Option selected: image, link, manual
- Manual Creation Form
 - Recipe save
 - Recipe delete
 - Exited with unsaved changes
 - Image upload errors
- Image to Text Flow
 - Add image click
 - Image source selected: photo library, take a photo, choose a file
 - Select file and save click
- Recipe Template Actions
 - Edit selected
 - View Recipe upload
 - Save Heart, add to collection
 - Print selected
- Moderation
 - Recipe approved or rejected.
 - Failure reason moderation vs image
 - Moderation retry clicked

- Image retry clicked
 - Support Images FAQ clicked
- Loading Screen
Measure total loading duration from loading screen displayed to image processing completed

Ads

Adhesive ads:

- Add New Recipe modal
- Add From Image modal
- Add From Link modal
- Recipe Default Page view (in cook mode and out of cook mode)

Regular ads:

- Recipe Default Page (Lite Version)
- Ad before Ingredients section
- Ad after Directions section

Under Consideration

Max two photos upload guidelines

- Limit uploads to a maximum of two photos per recipe submission. Least amount of additional dev effort.
- On desktop, clearly display uploaded file names so users can see what has been selected.
- Allow users to remove an uploaded file before submission and replace it.
 - File displayed with progress loading circle
 - File displayed with “Delete” functionality upon upload completion
- Error handling and edge cases
 - If either uploaded file fails moderation, block the entire submission.
 - Direct to Moderation Failure screen
 - If either uploaded file cannot be scanned, block the entire submission.
 - Direct to Image Failure screen
 - If either file is not supported, show a warning message
 - If either file is too large, show a warning message
- Ensure the upload UI can accommodate two files without feeling cramped. This may require a larger modal.
- On the default recipe page, multiple images should be taken into account.
 - Main image (max 2 images)

- Carousel or AR “gallery” style format?
- Image source (max 2 images)
 - Should be displayed as a carousel in a lightbox (already built out in Meridian)

3 TEAMS / DEPENDENCIES

- Flex 2 (Chantelle James Luke Pierotti Aleza Leinwand)

4 COMPETITORS

✚ Recipe Clipping Competitive Features Comparison

5 DESIGNS

🔗 AR_Add a Recipe

Competitive Analysis 🔗 Miro

🔗 MYR Recipe Clipper Phase 2

6 Launch and Rollout Plan

Action Plan

Add a recipe form

- ☒ Audit existing AR fields vs recipe needs
- ☒ Align on field set (title, ingredients, steps, time, photo, source)

- ☒ Map flow from upload → edit → save
- ☒ Include moderation reqs for user content
- ☒ Create low-fidelity sketches and user flow
- ☒ Validate with 3–5 users for clarity and ease of use
- ☒ Review w/ stakeholders

OCR

- ☐ Run technical spike for image/screenshot extraction, including dependency check
 - ☐ Luke Pierotti to investigate back-end workflows
- ☒ Define MVP coverage (name, ingredients, steps, yield, time)
- ☒ Document fallback flow when OCR fails or is partial
- ☒ Validate editable preview workflow (user confirms or edits before saving)
- ☐ Verify legal requirements/considerations (image rights)
- ☐ Validate OCR UX with users (speed + accuracy perception)
- ☒ Create low-fidelity sketches for OCR + edit state
- ☒ Review w/ stakeholders

Recipe template

- ☒ MYR recipe template reqs - decide which features of the template to use
 - ☒ No UGC
- ☐ Getting dev sign-off
- ☒ Ensure schema supports new recipe types (custom, handwritten)
- ☒ Define visual system for source indicators (camera, scissors, globe)
- ☒ Lock template version and sketches

Milestones

- **Week of 12/1:** Final reqs to pass on
- **Week of 12/8:** Review low-fidelity concepts and user flow with stakeholders
- **Week of 12/15:** User testing of different forms
- **Week of 1/5:** Present mid-fidelity designs for approval; incorporate feedback and prep for dev handoff
- **Week of 1/12:** Cross-team planning estimation
- **Week of 1/26:** Development kickoff; engineering begins to build on approved designs and defined MVP scope. Loop in marketing

🔗 MYR Recipe Clipper Phase 2

Meeting Notes

Jan 14, 2026 | Stakeholder Design Review

Design Direction Review

- MVP scope narrowed down for Clipper Phase 2 development
- Save from image flow prioritized as main feature
- Upload limited to single image per recipe
 - Processing time: 6.5 seconds per image
 - Technical complexity concerns with multiple images
 - Future phase consideration for multi-image support
 - User understanding unclear: copy needs updating to specify “single image” requirement
- User flow: Save from image → Upload → Loading → Recipe page → Edit options
- Edit functionality hidden behind three-dot menu (following current UX patterns)
 - UX risk: users may not discover edit capability without visual cues
 - Consideration for first-time messaging: “continue to edit” prompts
- Recipe requirements: Title + at least one ingredient minimum to save
- Open question: prioritize “upload image” option first in entry points and promo copy
 - Image upload more universal vs. link saving (limited to 1400 websites)

Technical Considerations & User Cases

- Screenshot uploads supported (Instagram, cookbooks, recipe cards)
 - Legal cleared for private collection saves
 - No public sharing restrictions
- Multi-page recipe card challenge identified
 - Rich’s grandmother’s two-sided cards use case
 - Current limitation: must fit entire recipe in single photo
 - UX risk: users may not know how to photograph two-page cookbook spreads
 - Potential future investigation: photo stitching capability
- Error handling needed for moderation failures, blurry images, file size issues

- Meeting scheduled with Tammy tomorrow on AI discovery work for recipe text extraction

Monetization & Ad Placement

- Adhesive ads performing well in current preview flows
- Proposed ad placements:
 - Below three primary buttons in upload modal during selection process
 - Same ad density as standard recipe pages post-upload
 - Cook mode adhesive ads maintained
- Personal recipe ad strategy: exploring “ad-lite” version template
 - Fewer ads naturally (no reviews, intro sections)
 - Consideration for ad-free personal recipes vs. revenue needs
- Processing screen (6-second loading) identified as ad opportunity
- Share button requested next to print (privacy discussions ongoing)

Next Steps

- Design mocks to include adhesive ad placements (SRI to provide ingredients/steps ad examples)
- Finalize ad strategy for personal recipes by Friday deadline
- Update copy to clarify “single image” requirement
- User testing results analysis in progress
- Backend sharing collections meeting schedule

Dec 18, 2025 | Design/Prod Sync

Recipe Form Requirements Finalization

- Moving forward with form option B (most basic version)
 - Includes reordering functionality but prioritizing speed to market
 - Only recipe name will be required field
 - All other fields optional (description, source, photo, serving time, ingredients)
- Photo upload specifications
 - Single image only (stakeholders vetoed multiple images)
 - No cropping or editing functionality
 - Accepted formats standard, displayed as-is
- Global save behavior
 - Save only available once recipe name entered
 - Error notification required when users try to save without title
 - Saves as personal recipe, goes directly to moderation

Template Display and User Experience

- Recipe card customization
 - Personal recipe badge needed on recipe cards (not template itself)

- Fallback image required for My Recipes brand when no photo uploaded
 - Primary photo displays if available
- Template layout decisions
 - Hidden fields approach: show section headers but no content if unfilled
 - Three-dot options menu preferred over individual edit buttons
 - Include: Edit, Add to Collection, Print, Delete
 - Date created/last updated consideration pending Zach discussion
- Edit functionality flows back to original form (same edit experience regardless of creation method)

OCR Image Upload Flow

- Technical specifications
 - Image moderation timing: 0.3-5 seconds expected
 - Loading animation under 5 seconds, “reviewing recipe” message if longer
 - iOS photo library integration (investigating if “choose file” option removable)
- Moderation and error handling
 - Two distinct failed states needed:
 1. Failed image upload/processing
 2. Content not passing moderation
 - Moderation occurs before and after extraction
 - Failed recipes deleted from backend, need CTA for retry/redirect
- Edit limitations from OCR flow
 - Users must restart entire upload process to change image
 - Cannot re-use OCR functionality in edit mode

Next Steps

- Andrea: Complete form wireframes and nail down requirements with Zach by end of week
- Andrea: Set up user testing in dScout with Zach’s help for next week
- Chantelle: Confirm technical feasibility with Luke (options menu complexity, ingredient adjuster, cook mode integration)
- Chantelle: Share requirements with legal and stakeholders once mocks complete
- Both: User testing sessions next week (Chantelle to participate/observe)

Dec 18, 2025 | Mid-Fi Designs

Recipe Clipper Mid-Fi Wireframes Review

- Andrea presented updated mid-fidelity wireframes for Recipe Clipper Phase II
- Focus on image-to-text flow and detailed form design for web implementation

- Key decision: Building Flow 1 (native OS system integration) for desktop rather than custom screens

Upload Flow & Moderation Process

- Upload interface allows drag/drop with 5-image limit per recipe
 - Large upload box for desktop users
 - “Add images” button accesses OS photo library/camera
 - File type and size restrictions built in
- Moderation timing critical for user experience
 - Image moderation: 0.3-5 seconds currently being investigated
 - Text moderation: Processing under 1 second for current short text
 - Loading screen handles both processes before showing recipe template
- Pending state notification only appears if moderation exceeds loading threshold

Technical Challenges & Open Questions

- What happens if OCR fails or only partially succeeds?
- Are we handling photos with multiple recipe cards in a single image?
- Stay awake like cook mode during form entry?

Form Design Options & V1 Scope Decisions

- Two form approaches presented:
 - Full-featured with drag/drop reordering capabilities
 - Simplified clean UI without reordering (recommended direction)
- Reordering functionality cut from V1 scope
 - More important for shopping lists than recipes
 - Web drag interactions problematic on mobile
 - No competitors found with web reordering
- Single image upload suggested for V1 vs multiple images
 - Reduces complexity around sequencing and processing
 - Primary use case: phone photo of single cookbook page/recipe card
- Save/unsave recipe flow needs clarification
 - Recipe auto-saved upon creation
 - Collection assignment popup appears few seconds after load
 - Delete functionality only available from saves page

Next Steps

- Team to review designs over holiday break and reconvene with fresh perspective
- Performance testing for image/text moderation to optimize loading times
- Loop in Legal on designs

Clipper Phase 2 User Flow Overview

- Image-to-recipe OCR scanning functionality to digitize recipes from cards/cookbooks/magazines
- Editable recipe form and default recipe page components
- Key competitive insights:
 - Allow uploads from gallery and camera (mobile focus)
 - Provide optimal photo tips for OCR scanning
 - Support multiple page uploads for complex recipes
- Moderation validation added for user-uploaded content

Two Flow Options Reviewed

- Flow 1: Native OS-focused experience
 - Leverages familiar mobile device screens/interactions
 - Users taken to edit recipe form after OCR scanning
 - More screens but follows established patterns
- Flow 2: Streamlined custom approach
 - Fewer screens, direct path to default recipe page
 - Assumes users want to cook immediately after upload
 - Custom camera interface with multi-photo capability (up to 5 images)
- Both flows include loading screens and moderation states with pending badges

Technical Considerations & Decisions

- Web vs app functionality limitations identified
 - Many competitor features are app-based with deeper device permissions
 - Native app planned for summer next year but web functionality should mirror where possible
 - OCR feature prioritized over web form by senior management for marketing value
- Moderation implementation:
 - Using Resound tools (same as current scraper)
 - Quick turnaround expected based on current performance
 - Legal review needed once mid-fidelity designs ready
 - Connect with Tammy and Michael Olsen exploring image recognition
- Recipe template considerations:
 - Support for original uploaded image display alongside final dish photo
 - Collection assignment capability during or after moderation
 - Required vs optional field decisions needed for quality control

Next Steps

- Andrea: Research web-based competitor flows for technical feasibility comparison
- Andrea: Move to mid-fidelity frames and explore recipe form details
- Luke: Investigate web capabilities for photo upload/camera functionality
- Chantelle: Connect with legal team (navigate Jen Bishop's maternity leave)
- Team: Schedule follow-up review for next iteration before end of year

Nov 18, 2025 | Audit Review

Key Design Decisions Needed

- "Add a Recipe" form consistency
 - Question: Mirror existing AR experience or create recipe-specific design?
 - Need to revisit previous detailed interactions vs current simplified approach
- Recipe page template design
 - Must establish before finalizing form requirements
 - Form accommodates whatever recipe template needs
 - Can leverage existing recipe page design work (simplified version)
- Source indication system
 - Explore symbols/markers showing clip method (scissors icon, camera, etc.)
 - Users want to remember recipe sources and organize collections accordingly
- Priority decision: OCR vs Form development
 - OCR potentially more user-attractive and "slicker"
 - Enables future restaurant dish photo features
 - Form still required for editing OCR results
- Legal considerations for image sourcing (per Jen Bishop guidelines)

Next Steps

- Technical validation Chantelle James /Luke
 - Confirm AI and OCR dependencies
 - Check text extraction capabilities and outputs
 - Verify legal requirements/considerations
- Design exploration
 - Create low-fidelity sketches for different directions
 - Draft user flow diagrams connecting upload and form
- User validation around recipe form preferences
- Schedule design discussion for My Recipes recipe page layout Chantelle James

Legal Requirements Cont.

Legal Requirements - PRIVILEGED AND CONFIDENTIAL

For MVP, personal recipes remain private to the creating user, with support for link based sharing. A future phase will support collection based sharing. Recipe text is non copyrightable. Recipes may include images. Legal guidance has been reviewed to confirm whether images may be included when sharing is enabled.

Legal Determinations

Image sharing

Images may be included when recipes or collections are shared via links or collections. This applies to both personal and external recipes. Images do not need to be hidden or removed at share time.

Image rights and risk

User uploaded images are treated as user generated content. Users are responsible for ensuring they have the right to upload and share images. Legal is comfortable relying on existing UGC language in the Terms of Service. Some third party IP risk remains and is accepted for MVP.

Minimum rights required

No additional image rights beyond the current Terms of Service are required. Full commercial usage rights are not required.

Product implications

Image inclusive sharing may proceed for both link and collection sharing. No image gating, creator validation, or conditional hiding logic is required, avoiding additional engineering complexity.

Follow ups

Legal may update UGC language in a future Terms of Service revision, but current coverage is sufficient to proceed.

Breakouts

Feb 12, 2026 | Clipper phase 2 planning

Feb 11, 2026 | Discuss Clipper team resourcing and launch plan

Agenda and notes

- Review team estimates with resource updates
 - Update from 2/10
 - Koppi's available for BE support for Clipper phase 2.
 - He should be to start from sprint 4 or likely on 2/16 (with the caveat that MYR perf issues will take priority should they arise).
- Any scope adjustments for the Phase 2 release?
 - Potentially ~5 dev weeks of savings by treating ads and print template as fast follows
- Scope adjustment
 - Ads and print template
-

Next steps

- Identify BE work(expose endpoints) and coordinate with Billy - Luke
- Revisit saving /clipping functionality
 -
 -
- [pick.sy](#) - anything we can leverage ?

Feb 10, 2026 | Discuss Clipper team resourcing and launch plan

Agenda and notes

- Review team estimates with resource updates
 - Identified ~5 dev weeks of savings by treating ads and print template as fast follows
 - Without PTO, total dev effort reduces from ~11.5 sprints to ~10 to 10.5 sprints
 - Engineering PTO adds ~2 to 3 dev weeks, largely concentrated Mar–May
 - Net impact with PTO included brings total dev effort back to ~11 to 11.5 sprints
 - Resulting earliest realistic dev completion is mid to **late July 2026**
- PTO Summary
 - Engineering PTO only

- • Emilia ~2 weeks
- • Koppi is OOO March 2 - 6.
- • Kevin ~10 days ≈ 2 weeks
- • Doug ~3 to 5 days ≈ 0.5 to 1 week
- (Total eng PTO = ~4.5 to 5 weeks of engineer time
- Schedule impact
 - 1 calendar week = 3.5 engineer weeks
 - 4.5 to 5 engineer weeks ÷ 3.5 = ~1.3 to 1.4 calendar weeks)
- Math puts eng PTO at about a week and a half of schedule impact, but with clustering and inefficiency, it's safer to plan for two to three weeks.
- Use team velocity for initiative burndown ?
 - Revisit once we have the tickets pointed.
- Next steps
 - Bithika to connect with Michelle on Koppi's availability for BE support
 - Regroup with Food flex QA - targeting next week once more the work is outlined in Jira tickets - Bithika to coordinate with FFT
 -

Feb 5, 2026 | Discuss Clipper team estimates

Clipper v2 Estimates Overview

- Total timeline: 23 dev weeks (concurrent work reduces to ~12 weeks actual time)
- Form development: 6 weeks frontend, 17 weeks backend
 - Backend complexity: Creating documents in Selene, authors in Graphene, attribution setup
 - Multiple service integrations required for document creation flow
- Image OCR processing: Separate workstream with OpenAI integration
 - New backend service needed for AI integrations
 - Infrastructure will support future social media recipe extraction feature

Scope Reduction Opportunities

- Frontend optimizations identified:
 - Remove ads from initial launch (significant time savings)
 - Reduce from 2 images to 1 image upload option
 - Deploy ads as fast-follow during UAT process
- Backend harder to reduce due to core infrastructure requirements
- Luke to provide detailed breakdown of potential cuts by end of day

Resource Allocation & Next Steps

- Current constraint: Losing one engineer to entertainment program
- Potential additional resources:
 - Copy from Stardust team (underutilized per Michelle)
 - Doug Brown from community team
 - Kevin with backend experience
- Shopping list project also needs backend resources in March
- Kevin meeting with Rich in 1 hour to discuss timeline and get approval
- Future synergy: This work enables faster social media-to-recipe feature for ap

Feb 4, 2026 | Discuss Clipper Phase 2 LOE

Agenda and notes

- Discuss LOE for Spikes
 - FFT-395: MYR Clipper II - Spikes
 - OCR spike > 1 sprint
- Open questions
 - My Recipes Attribution & Usernames - breakout 2/4
 - Two images vs one image decision pending performance impact analysis
 - Next steps to address this ?
 - Handled in OCR spike
 - Dependency on APP summer launch timeline- any integration considerations with vendor Xmartlabs
 - Any dependencies on releasing -Platform docId Field Standardization (<https://dotdash.atlassian.net/browse/FFT-82>) first?
 -
- Development sequence:
 - Recipe form first
 - 23 wks, account for spike tike
 - 6 Frontend weeks
 - 17 Backend weeks (including resound work)
 - Template work - 14 wks
 - 14 Frontend weeks
 - 0 Backend weeks
 - Modal updates - 4wks
 - 4 Frontend weeks
 - Image OCR (dependent on form/template completion)
 - 22-26 wks (async moderation or not will impact this time estimate
 - 6 Frontend weeks
 - 16-20 Backend weeks (including resound work)

- Recipe deletion - 6 wks
 - 6 Backend weeks
- Click tracking/analytics - 6wks
 - 3 Frontend weeks
 - 3 Backend weeks
- 33 Frontend Dev Weeks
- 42-46 Backend Dev Weeks
- (Dev only) Total effort 75 - 79 weeks
 - Form FE and OCR can start
 - 79 weeks divided by 3.5 engineers is about 22.6 weeks, ~11.5 dev sprints
 - Assumes full development capacity and does not account for sick time or vacation
 - Earliest dev complete date
 - 22 weeks from Feb 4
 - Mid-Sprint 14, around July 15, 2026
- Auto / QA Estimates to come
 - Full two weeks

Work scope

- Recipe Form -23 wks

- build out vue form (not a ticket)
 - create new template that serves form
 - set up base form in vue
 - image upload component
 - ingredient inputs
 - directions inputs
 - logic for ingredient/directions headers
- massage data to match selene structure (need to hash docId to create the url for selene doc)
- data sanitization
- backend code to save recipe (not a ticket)
 - new endpoint
 - new service
 - moderation of image and text (need to create new services that interact with moderation services)
 - create author
 - find or create attribution
 - create document in selene
 - create document in graphene
 - resound work
 - create bookmark
 - return success and redirect user

- Recipe Template (CJ)

- create new template that serves components
- setting up base components (header, image, cook times, ingredients, directions, cook mode, notes)
 - lightbox for original OCR image
 - keep editing component
 - edit/delete
 - save button that opens modal collection
 - print template
- **modal updates (CJ)**
 - add new buttons to trigger flows
- **OCR flow**
 - frontend
 - image upload dialog and animation
 - error pages
 - backend
 - brand new service that we will create using ivy (not a ticket)
 - need to set up infrastructure
 - test openai prompts
 - will make call to open ai
 - process response
 - moderation work (not a ticket)
 - setting up moderation sync
 - setting up moderation async
 - build out new moderation functionality for recipe
- Recipe deletion
 - delete flow in service
 - recipe delete endpoint in resound
- Click tracking (CJ)
- Ads (CJ)

Next steps

- ☐ Luke Pierotti to add a FE +BE task breakdown to help with resource discussions
- ☐ Bithika Adhikary to check-in with Ted/ACT/PDO on how we are accounting for Summer Fridays, summer holidays, sick days etc for launch date estimations.
 - ☐ Check with FF2 team on planned summer time off
- ☐ Chantelle James to add the Jira tickets based on the above breakdown.

Feb 2, 2026 | Luke/Chantelle

Agenda and notes

Sprint Planning & Capacity

- Next sprint priorities:
 - Spike (5 points) and safe supported list implementation
 - Learning courses continuation
 - Moderation spike (Doug handling OCR, Amelia on image moderation)
- Text moderation service ending support end of year
 - Need ChatGPT-based solution with recipe-specific prompts
 - Will develop separate solution within moderation service
- Performance issue blocking work - Abu Bakr handling on image service side
 - No additional work required from team
 - Will retest once resolved

My Recipes Attribution & Username Planning

- Jeremy confirmed username plans for future (on roadmap)
- Need attribution data for each user-added recipe
 - Currently using email as attribution
 - Future: switch to usernames when available
- Clipper implementation capturing source and attribution separately
 - Maintains traceability for user-uploaded recipes
 - Data services could rewrite attributions when usernames added

Mirror Project Breakdown & Timeline

- Luke breaking down into tasks with dev week estimates
- Estimated 20 dev weeks for recipe form alone
 1. 3-4 engineers = ~3.5 months (not including QA/automation)
 2. Doesn't account for sick days, vacation, outside work
- Development sequence:

1. Recipe form first
 2. Template work
 3. Image OCR (dependent on form/template completion)
- Two images vs one image decision pending performance impact analysis
 - Timeline concerns with app launch (May/June target)
 - Southern Living font work ready to start once March timeline confirmed

Jan 29, 2026 | Clipper Phase 2 -Team planning

Agenda and notes

- Map out the work needed to launch Clipper Phase 2 (Design, FE, BE, QA etc) and add tentative time estimates for completion
 - Image OCR
 - Recipe Form
 - Recipe Template
 - Recipe Modal update

Jan 26, 2026 | Direction for Clipper personal recipes in search

Agenda and notes *(Draft)*

- UGR vs external vs personal MYR in Search
 - Current state
 - Allrecipes UGR recipes appear in the Save carousel within search results only for users who have saved them.
 - Clipper external recipes do not appear in search at all. In the future, we want these to surface for users who have saved them.
- Decision to align on
 - Clipper personal recipes surfaced via search will only be visible to the creator, meaning the user who saved the recipe.
 - Search & Discovery Team

Jan 21, 2026 | Clipper 2 -Planning and team estimation

Agenda and notes (*Draft*)

- Review the scope of phase 2 Chantelle James Andrea Watson
 - Link to Figma design
- Feature planning and work breakdown
 - Link to Miro board

Jan 20, 2026 | Clipper Phase 2 -Implementation overview

Agenda and notes

- Technical Implementation overview of Clipper Phase2
 - Documentation:
<https://dotdash.atlassian.net/wiki/spaces/~542771034/pages/6229196801/WIP+Recipe+Clipper+Phase+2+Technical+Approach+and+Agreements>
- Feedback from cross team leads/ discuss any questions
 -

Team 000

Flex 2 Team OOO (till July 2026)

- Sabreen: Potentially 2 weeks either end of March or April
- Emilia: I plan to take some time - not sure of the exact dates so it might not be pre-July; most likely it will be 2 weeks
- Victoria: Out for 7 days end of March - beginning of April
- Erickka: A “smattering” of days mostly thurs/Fridays off march through july
- Sana: Likely 2 weeks off in july or august apart from the summer fridays that start end of may.
- Kevin Walch: 10 days
- Doug Tschette: Probably several days in May (ish)

PRD Social Saving (APP)

1 OVERVIEW

1.1 Business Goals

- Enable users to save recipes directly from TikTok and Instagram when the app launches.

1.2 Product Purpose / Value Proposition

- Let users save a social video and turn it into a clean, structured recipe in seconds.

1.3 Target Audience Profile(s)

- People who regularly discover recipes on TikTok and Instagram and want an easy way to save and organize them in one place.

1.4 Desired User Outcomes

- User can quickly save a video and receive a clear, usable recipe they trust.

1.5 Metrics of Success

- Percent of save attempts that complete successfully.

1.6 Potential Risks / Negative Impacts

- Poor transcript quality leading to bad recipes.
- AI errors such as missing or incorrect ingredients.

1.7 Underlying Assumptions

- Most social videos contain enough information to build a usable recipe.
- We can match the quality users see in competitor products.

1.7 Dependencies

- iOS share extension
- Backend system to accept and process URLs
- Transcript extraction
- AI recipe generation

1.9 Target Time-Frame

- Spikes completed by: end of Feb
- MVP ready for APP launch: TBD

2 KNOWN REQUIREMENTS

2.1 Feature Overview

Users can paste a TikTok or Instagram URL into the app to generate a structured recipe.

Manual URL entry

iOS share sheet support

All imports create one processing job in the backend.

2.2 Supported Sources and Inputs

- Public TikTok videos
- Public Instagram videos

Private or restricted videos are not supported in MVP.

Validation Inputs Import

MVP V1

Content is directly in the post:

- Ingredients or steps written in the caption
- Recipe instructions spoken in the video audio

V2

Content requires leaving the post:

- A direct recipe URL included in the caption (V1 if timing allows)
- “Link in bio” to access the full recipe

V3

More complex extraction:

- Text overlays within video or images
- Carousel posts where recipe content appears across slides

2.3 Core Flow

Manual URL Entry

1. User opens the Link Import modal
2. User pastes a TikTok or Instagram URL
3. User taps Save
4. System validates the URL and creates a processing job
5. User sees a Processing state
6. On success, an imported recipe modal is shown
7. On failure, a clear error message is shown

Notes

- Clipboard paste is supported
- Duplicate submissions are allowed

iOS Share Sheet

1. User taps Share in TikTok or Instagram
2. User selects our app
3. URL is passed to the app and a processing job is created
4. User sees a Processing state
5. On success, an imported recipe modal is shown
6. On failure, a clear error message is shown
7. User can save the recipe
8. After save, show success message with option to open the app or return to the social app

2.4 Process Experience

If processing time is:

1. After import recipe, show a full-screen “Building your recipe” loading screen.
2. If processing completes within 20 seconds, show the generated recipe.
3. If processing exceeds 20 seconds, continue in background and inform the user it will appear in Saved when ready. (Processing continues server side even if the user closes the app.)
4. If processing fails, show an error message.

Processing time thresholds may be adjusted after spike testing.

2.5 Processing Pipeline

For each valid URL:

1. Validate URL
 - A URL is valid if:
 - It is from a supported platform (Instagram/TikTok)
 - The post is publicly accessible
 - We can retrieve at least one of the following: caption text or video audio
 - If validation fails, stop processing.
2. Extract caption text
3. Transcribe audio if video is present
4. Generate recipe using AI using both caption and audio as inputs when available
 - a. Spike to determine input hierarchy and weighting.
5. Store recipe

Notes

- No automatic retries for failed jobs in MVP
- Transcript is used for processing only and not exposed to users

2.6 Recipe Output Requirements

Generated imported recipe includes:

- Title
- Description
- Image
- Ingredient list, quantities
- Ordered steps
- Servings
- Prep Time, Cook Time, Additional Time (Chill, Marinate, Soak, Rest)
- Original source URL must be stored with the recipe.

Notes

- Non-English recipes are supported. Generated content is preserved in the original language.

2.7 Status and Errors

User sees status:

- Processing
- Ready
- Failed

Failure reasons:

- Invalid or unsupported URL
- Private or inaccessible video
- Transcript failure
- AI generation failure

User sees a clear error message.

2.8 After Import

When recipe is ready, user can:

- Edit ingredients
- Edit steps
- Assign to collections
- Save recipe
- Report import issue

2.9 Recipe Visibility and Sharing

- All social saved recipes default to Private
- Direct link sharing

Open Decisions

- Acceptable processing time target
- Retry and timeout policy

Spikes

Spike 1**Instagram URL Ingestion Feasibility****Spike 2****TikTok URL Ingestion Feasibility****Spike 3****YouTube Ingestion Feasibility****Spike 3****AI Prompting Strategy for Social Video to Recipe****Spike 5****Backend Social Link Save API for App****Spike 6****iOS App to App Save Flow Feasibility for TikTok and Instagram****Spike 7 (later phase)****Desktop Chrome Extension Save Flow Feasibility**

Spike: Instagram URL Ingestion Feasibility**Spike goal**

Assess feasibility of ingesting public Instagram URLs and extracting transcript or on screen text.

Acceptance criteria

- Test 15 to 20 representative public Instagram URLs across key content types, including Reels, standard video posts, and posts with text overlays.
- Determine most reliable method to retrieve audio and text.
- Measure success rate of extracting usable transcript or on screen text
- Identify and categorize common failure modes and platform constraints
- Outline the proposed flow from URL submission to transcript output
- Estimate high level production effort
- Deliver a short findings summary with clear recommendation on how to proceed

Spike: TikTok URL Ingestion Feasibility

Spike goal

Assess feasibility of ingesting public TikTok URLs and extracting transcript or on screen text.

Acceptance criteria

- Test 15 to 20 representative public Instagram URLs across key content types, including Reels, standard video posts, and posts with text overlays.
 - Determine most reliable method to retrieve audio and text.
 - Measure success rate of extracting usable transcript or on screen text
 - Identify and categorize common failure modes and platform constraints
 - Outline the proposed flow from URL submission to transcript output
 - Estimate high level production effort
 - Deliver a short findings summary with clear recommendation on how to proceed
-

Spike: YouTube URL Ingestion Feasibility

Spike goal

Validate ability to ingest public YouTube URLs and extract usable captions or on screen text.

Acceptance criteria

- Test 15 to 20 representative public Instagram URLs
 - Determine based way to grab youtube content
 - Measure success rate of extracting usable transcript or on screen text
 - Identify and categorize common failure modes and platform constraints
 - Outline the proposed flow from URL submission to transcript output
 - Estimate high level production effort
 - Deliver a short findings summary with clear recommendation on whether to proceed
-

Spike: AI Prompting Strategy for Social Video to Recipe

Spike goal

Identify the most effective prompting and validation approach to convert social video transcripts into high quality, production ready recipes.

Production ready definition

- Clear recipe title
- Complete ingredient list with quantities
- Logical, ordered steps

Acceptance criteria

- Test 25 to 30 representative transcripts
- Compare multiple prompting strategies and validation approaches
- Measure pass rate against the production ready definition
- Identify common failure modes and how each approach handles them
- Estimate cost per recipe and typical latency for each approach
- Recommend the prompting and validation strategy to use in production
- Deliver a short findings summary with clear recommendation

Spike 5: Backend Social Link Save API for App

Goal

Design and validate the backend system that takes a social video URL, extracts the content, turns it into structured recipe data, and makes that data available to the app.

Acceptance criteria

- Show a proposed end to end flow from URL submission to structured recipe output in one clear diagram
- Define what the app sends to backend and what backend returns
- Define the small set of processing states the app will see
- Identify the top 3 technical risks that could block or significantly complicate production
- Estimate rough build effort by major component
- Deliver a recommendation: build now, de risk further, or do not pursue

Spike: iOS App to App Save Flow Feasibility for TikTok and Instagram

Goal

Determine whether users can reliably save TikTok and Instagram videos into our app via the iOS share sheet and whether we receive a usable URL to initiate ingestion.

Context

Recipe uses the iOS share sheet to capture TikTok and Instagram links and processes them server side.

Scope

This spike focuses only on save capture and URL reliability. It does not include transcript extraction or recipe generation.

Acceptance criteria

- Document what data iOS provides via share sheet for TikTok and Instagram
- Test 10 to 15 representative shares across both platforms
- Measure success rate of capturing a usable canonical URL

- Identify major failure modes and platform constraints
- Provide recommendation on feasibility, risks, and production path including high level LOE

Breakouts - Social Save

Feb 20, 2026 | Discuss Social recipe saving (Instagram & TikTok etc)

Objective

Review the proposed user initiated social saving model and confirm the legal framework, limitations, and protections required for launch.

Agenda

1. Context and Model Overview
 - Business rationale
 - User initiated flow and technical summary
2. Platform Terms
 - Public URL retrieval approach
 - Platform specific considerations
 - Technical implementation implications
3. Copyright
 - Boundaries of factual extraction
 - Attribution and private user storage
 - Image storage
4. Data and Contractual Considerations
5. Liability and Takedown
6. Monetization

Outcome

Alignment on required guardrails, disclosures, and operational processes to support launch.
